# Introduction

Thank you for purchasing the FH/FHV Series.

This manual contains information that is necessary to use the FH/FHV Series.

Please read this manual and make sure you understand the functionality and performance of the FH/FHV Series before you attempt to use it in a control system.

Keep this manual in a safe place where it will be available for reference during operation.

# **Intended Audience**

This manual is intended for the following personnel, who must also have knowledge of electrical systems (an electrical engineer or the equivalent).

- Personnel in charge of introducing FA systems.
- · Personnel in charge of designing FA systems.
- Personnel in charge of installing and maintaining FA systems.
- · Personnel in charge of managing FA systems and facilities.

# **Applicable Products**

This manual covers the following products.

- FH-100
- FH-1000-00
- FH-2
- FH-2000-00
- FH-3
- FH-3000-00
- FH-5000
- FH-5000-00
- FH-L
- FH-L
- FHV70-000

Part of the specifications and restrictions are given in other manuals. Refer to Relevant Manuals on *Relevant Manuals* on page 2 and *Related Manuals* on page 17.

# **Relevant Manuals**

The following table provides the relevant manuals for the FH/FHV Series.

Read all of the manuals that are relevant to your system configuration and application before you use the FH/FHV Series.

# **Manual Structure**

# **Page Structure**

The following page structure is used in this manual.

Note This illustration is provided only as a sample. It may not literally appear in this manual.

# **Special Information**

Special information in this manual is classified as follows:

#### **Precautions for Safe Use**

Precautions on what to do and what not to do to ensure safe usage of the product.

#### **Precautions for Correct Use**

Precautions on what to do and what not to do to ensure proper operation and performance.

#### **Additional Information**

Additional information to read as required. This information is provided to increase understanding or make operation easier.

# **Conventions Used in This Manual**

Use of Quotation Marks and Brackets In this manual, menus and other items are indicated as follows.

Bold	Menu	Indicates the menu names or processing items shown in the menu bar.
Italic	Item name	Indicates the item names displayed on the screen.

# **Terms and Conditions Agreement**

#### Warranty, Limitations of Liability

#### Warranties

Exclusive Warranty:

Omron's exclusive warranty is that the Products will be free from defects in materials and workmanship for a period of twelve months from the date of sale by Omron (or such other period expressed in writing by Omron). Omron disclaims all other warranties, express or implied. *Limitations:* 

OMRON MAKES NO WARRANTY OR REPRESENTATION, EXPRESS OR IMPLIED, ABOUT NONINFRINGEMENT, MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE OF THE PRODUCTS. BUYER ACKNOWLEDGES THAT IT ALONE HAS DETERMINED THAT THE PRODUCTS WILL SUITABLY MEET THE REQUIREMENTS OF THEIR INTENDED USE. Omron further disclaims all warranties and responsibility of any type for claims or expenses based on infringement by the Products or otherwise of any intellectual property right. *Buyer Remedy:* 

Omron's sole obligation hereunder shall be, at Omron's election, to (i) replace (in the form originally shipped with Buyer responsible for labor charges for removal or replacement thereof) the non-complying Product, (ii) repair the non-complying Product, or (iii) repay or credit Buyer an amount equal to the purchase price of the non-complying Product; provided that in no event shall Omron be responsible for warranty, repair, indemnity or any other claims or expenses regarding the Products unless Omron's analysis confirms that the Products were properly handled, stored, installed and maintained and not subject to contamination, abuse, misuse or inappropriate modification. Return of any Products by Buyer must be approved in writing by Omron before shipment. Omron Companies shall not be liable for the suitability or unsuitability or the results from the use of Products in combination with any electrical or electronic components, circuits, system assemblies or any other materials or substances or environments. Any advice, recommendations or information given orally or in writing, are not to be construed as an amendment or addition to the above warranty.

See http://www.omron.com/global/ or contact your Omron representative for published information.

#### • Limitation on Liability; Etc

OMRON COMPANIES SHALL NOT BE LIABLE FOR SPECIAL, INDIRECT, INCIDENTAL, OR CONSEQUENTIAL DAMAGES, LOSS OF PROFITS OR PRODUCTION OR COMMERCIAL LOSS IN ANY WAY CONNECTED WITH THE PRODUCTS, WHETHER SUCH CLAIM IS BASED IN CONTRACT, WARRANTY, NEGLIGENCE OR STRICT LIABILITY.

Further, in no event shall liability of Omron Companies exceed the individual price of the Product on which liability is asserted.

#### **Application Considerations Warranties**

#### Suitablity of Use

Omron Companies shall not be responsible for conformity with any standards, codes or regulations which apply to the combination of the Product in the Buyer's application or use of the Product. At Buyer's request, Omron will provide applicable third party certification documents identifying ratings

and limitations of use which apply to the Product. This information by itself is not sufficient for a complete determination of the suitability of the Product in combination with the end product, machine, system, or other application or use.

Buyer shall be solely responsible for determining appropriateness of the particular Product with respect to Buyer's application, product or system. Buyer shall take application responsibility in all cases.

NEVER USE THE PRODUCT FOR AN APPLICATION INVOLVING SERIOUS RISK TO LIFE OR PROPERTY OR IN LARGE QUANTITIES WITHOUT ENSURING THAT THE SYSTEM AS A WHOLE HAS BEEN DESIGNED TO ADDRESS THE RISKS, AND THAT THE OMRON PROD-UCT(S) IS PROPERLY RATED AND INSTALLED FOR THE INTENDED USE WITHIN THE OVER-ALL EQUIPMENT OR SYSTEM.

#### Programmable Products

Omron Companies shall not be responsible for the user's programming of a programmable Product, or any consequence thereof.

#### Disclaimers

#### Performance Data

Data presented in Omron Company websites, catalogs and other materials is provided as a guide for the user in determining suitability and does not constitute a warranty. It may represent the result of Omron's test conditions, and the user must correlate it to actual application requirements. Actual performance is subject to the Omron's Warranty and Limitations of Liability.

#### Change in Specifications

Product specifications and accessories may be changed at any time based on improvements and other reasons. It is our practice to change part numbers when published ratings or features are changed, or when significant construction changes are made. However, some specifications of the Product may be changed without any notice. When in doubt, special part numbers may be assigned to fix or establish key specifications for your application. Please consult with your Omron's representative at any time to confirm actual specifications of purchased Product.

## Errors and Omissions

Information presented by Omron Companies has been checked and is believed to be accurate; however, no responsibility is assumed for clerical, typographical or proofreading errors or omissions.

# **Safety Precautions**

For details of Safety Precautions, refer to *Safety Precautions* in the *Vision System FH/FHV Series User's Manual (Cat. No. Z365).* 

# **Precautions for Safe Use**

For details of Precautions for Safe Use, refer to *Precautions for Safe Use* in the *Vision System FH/FHV Series User's Manual (Cat. No. Z365).* 

# **Precautions for Correct Use**

For details of Precautions for Correct Use, refer to *Precautions for Correct Use* in the *Vision System FH/FHV Series User's Manual (Cat. No. Z365).* 

# **Regulations and Standards**

For details of Regulations and Standards, refer to *Regulations and Standards* in the *Vision System FH/FHV Series User's Manual (Cat. No. Z365).* 

# **Related Manuals**

Name of Manual	Cat. No	Model	Purpose	Contents
Vision System FH Instruction Sheet	9608337-2	FH-1000 FH-1000-00 FH-3000 FH-3000-00	To confirm the safety and usage precau- tions of the Vision System FH series Sensor Controller.	Describes the definitions of basic terms, meaning of signal words, and precautions for correct use of FH series in the manual.
Vision System FH Instruction Sheet	3102269-4	FH-2000 FH-2000-00 FH-5000 FH-5000-00	To confirm the safety and usage precau- tions of the Vision System FH series Sensor Controller.	To confirm the safety and usage pre- cautions of the Vision System FH series Sensor Controller.
Vision System FH-L Instruction Sheet	9606631-1	FH-L000-00	To confirm the safety and usage precau- tions of the Vision System FH-Lite ser- ies Sensor Control- ler.	Describes the definitions of basic terms, meaning of signal words, and precautions for correct use of FH-L series in the manual.
Smart Camera FHV Instruction Sheet	3129404-0	FHV7D-DDDDD-C	To confirm the safety and usage precau- tions of the Smart Camera FHV7 ser- ies.	Describes the definitions of basic terms, the meaning of signal words, and precautions for correct use of FHV7 series in the manual.
Smart Camera Lighting Module FHV-LTM Instruction Sheet	3129276-4	FHV-LTM	To confirm the safety and usage precau- tions of the Smart camera lighting mod- ule FHV-LTM.	Describes the definitions of basic terms, the meaning of signal words, and precautions for correct use of the lighting module FHV-LTM in the manual.
Smart Camera Lens Mod- ule FHV-LEM-S Instruction Sheet	3128622-5	FHV-LEM-S	To confirm the safety and usage precau- tions of the Smart camera lens module FHV-LEM-S.	Describes the definitions of basic terms, the meaning of signal words, and precautions for correct use of the lens module FHV-LEM-S.
Smart Camera High-Speed Lens Module FHV-LEM-H Instruction Sheet	3129408-2	FHV-LEM-H	To confirm the safety and usage precau- tions of the Smart camera high-speed lens module FHV- LEM-H.	Describes the definitions of basic terms, the meaning of signal words, and precautions for correct use of the high-speed lens module FHV- LEM-H.
FHV Series Smart Camera Setup Manual	Z408	FHV7D-DDDD-C FHV7D-DDDD-SDD FHV7D-DDDD-SDD-D D FHV7D-DDDD-HDD FHV7D-DDDD-HDD-D D	When User want to know about the hard- ware specifications or to setup the Smart camera FHV series.	Describes FHV series specifications, dimensions, part names, I/O infor- mation, installation information, and wiring information.

The followings are the manuals related to this manual. Use these manuals for reference.

Name of Manual	Cat. No	Model	Purpose	Contents
Vision System FH/FHV Series User's Manual	Z365	FH-100 FH-100-00 FH-2000	When User want to know about the FH/FHV series.	Describes the soft functions, setup, and operations to use FH/FHV ser- ies/
Vision System FH/FHV series Processing Item Function Reference Manual	Z341	FH-2000-00 FH-3000-00 FH-3000-00 FH-5000 FH-5000-00 FH-5000-00	When User confirm the details of each processing items at the create the meas- urement flow or op- erate it.	Describes the software functions, settings, and operations for using FH/FHV series.
Vision System FH/FHV Series User's manual for Commu- nications Settings	Z342	FH-L000-00         FHV70-00000-C         FHV70-00000-S00-0         FHV70-00000-S00-0         0         FHV70-00000-H00         FHV70-00000-H00-0         FHV70-00000-H00-0	When User confirm the setting of com- munication functions.	Describes the functions, settings, and communications methods for communication between FH/FHV series and PLCs. The following communications proto- col are described. Parallel, PLC Link, EtherNet/IP, EtherCAT, and Non-procedure.
Vision System FH series Hardware Setup Manual	Z366	FH-1         FH-1         FH-2         FH-2         FH-3         FH-3         FH-5	When User want to know about the Hard-ware specifica- tions or to setup the Sensor Controller of the Vision System FH series.	Describes FH series specifications, dimensions, part names, I/O infor- mation, installation information, and wiring information.
Vision System FH series Macro Customize Func- tions Programming Manual	Z367	FH-5000-00 FH-L000 FH-L000-00	When User operate or programming us- ing Macro Customize functions.	Describes the functions, settings, and operations for using Macro Cus- tomize function of the FH series.
Vision System FH/FHV Series Operation Manual for Sysmac Studio	Z343	FH-1         FH-1         FH-2         FH-2         FH-3         FH-3         FH-5         FH-5         FH-5         FHV7         FHV7 <t< td=""><td>When User connect to NJ/NX series via EtherCAT communi- cation.</td><td>Describes the operating procedures for setting up and operating FH/FHV series Vision Sensors from the Sys- mac Studio FH/FHV Tools.</td></t<>	When User connect to NJ/NX series via EtherCAT communi- cation.	Describes the operating procedures for setting up and operating FH/FHV series Vision Sensors from the Sys- mac Studio FH/FHV Tools.

# **Revision History**

A manual revision code appears as a suffix to the catalog number on the front and back covers of the manual.

# 1-1 Introduction

This section describes a basic overview of the Sensor Controller control methods and the communication specifications, which is required when the FH/FHV series communicate with an external device.

Confirming the System Configuration
This section describes the external device configuration that is required to perform measurement processing with the FH/FHV.
For details, refer to 1-2 Confirming the System Configuration on page 1-3.
$\downarrow$
Communicating with an External Device
This section describes the basic operations of the Sensor Controller, and the communication specifications be
tween the Sensor Controller and an external device.
For Basic Flow of Communications and Signals, refer to 1-3-1 Basic Control Operations of the Sensor Control
<i>ler</i> on page 1-4
<ul> <li>Process from Starting Measurements at the Sensor Controller to Data Output:</li> </ul>
For details, refer to 1-3-2 Communications between the Sensor Controller and an External Device on page 1-5.

Setting Procedures for Communications
This section describes the procedures that are required to set up communications before starting communica-
tions between the Sensor Controller and an external device.
For details, refer to 1-5-1 Communications Setup Procedures on page 1-28.
$\downarrow$
Differences in Specifications Based on the Communications Protocol
This section describes the types and differences of communication protocols that are used for communication
with the Sensor Controller.
For details, refer to 1.5.2. Communications Protocols and Communications Madules on name 1.20
For details, refer to 1-5-2 Communications Protocols and Communications Modules on page 1-29.

# **1-2 Confirming the System Configuration**

The FH/FHV are Vision Systems that perform measurement processing through the Sensor Controller on measurement objects imaged by a Camera.

In a system configuration connected to an external device such as a PLC or a PC (personal computer), measurement commands can be received from and measurement results can be output to the external device.

# 1-2-1 System Configuration

An overview of the FH/FHV series system configuration is shown below.

The Sensor Controller and an external device (PLC, etc.) are connected with a communication cable and communicate with each other using various communication protocols. For details of various communication protocols, refer to *Section 2 Methods for Connecting and Communicating with External Devices* on page 2-1.

An LCD monitor (BOX type only) for operation and monitoring and a camera are connected to the Sensor Controller unit.

For details, refer to *Vision System FH Series User's Manual (Cat. No. Z365)*, *Smart Camera FHV Series Setup Manual (Cat. No. Z408)*, and the Instruction Manual provided with each individual device.

Communications Protocol	Communication Cable
Parallel	Parallel I/O cable
DL C Link	Ethernet cable
PLC Link	RS-232C cable
EtherNet/IP	Ethernet cable
EtherCAT	Ethernet cable
PROFINET	Ethernet cable
	Ethernet cable
Non-procedure	RS-232C cable

# **Communicating with an External De-**1-3 vice

This section describes the communication specifications, control methods in communications, and settings required before starting communications with an external device.

#### 1-3-1 **Basic Control Operations of the Sensor Controller**

The following figure shows basic communications, and the flow of signals and data, between an external device and the Sensor Controller.

PI C External device

Overall judgement

· Measured values

Character output

The following methods are used to exchange commands and data, between an external device and the Sensor Controller.

#### From an external device to the Sensor Controller

Туре		Description	
	Control signals (Input signal)	A measurement is performed when a measurement trigger (i.e., STEP signal: ON) is input. For information of control signals, refer to <i>Control Signals and Status Signals</i> on page 1-13.	
Control commands	Communications command input	You can send commands to perform measurements, switch scene groups, or perform other tasks. The communication commands depend on the communication protocol used. For details, refer to the section for each communication protocol.	

#### From the Sensor Controller to an external device

Туре	Description
Status signals	When the Sensor Controller recognizes a control signal or communication command in- put and starts measurement processing, it reports its status to the external device using status signals such as a BUSY signal. For details, refer to <i>Control Signals and Status</i> <i>Signals</i> on page 1-13.
Overall judgment	NG is output whenever there is one or more NGs in the judgment results for multiple processing items. It can be output using the OR signal or the TJG output parameter. For details, refer to <i>Control Signals and Status Signals</i> on page 1-13.
Measured values	The measured values for processing items are output. The items to be output need to be previously registered to the output data (data 0 to 7) using processing items for output. For details, refer to <i>Settings Required for Data Output</i> on page 1-21.

Туре	Description
Character output	This is valid in PLC Link and Non-procedure communications protocols. You can output character strings and numbers read by processing items such as Charac- ter Inspection, Barcode, or 2D Code. You can also use commands to acquire them after a measurement is performed. For details, refer to <i>Items that can be Output as Output</i> <i>Data</i> on page 1-19.

#### Additional Information

You can also use the FTP server to obtain logged image files and logged data files saved in the FH/FHV (including external storage) from a FTP client such as web browser.

# 1-3-2 Communications between the Sensor Controller and an External Device

Communications between the Sensor Controller and an external device are performed as shown below.

Here, describe how to start measurement with a communication command and to output data.

- (1) When the Sensor Controller receives a command from an external device such as a PLC, it performs the command and returns a response.
- (2) The measured data is output via the Communication module by the Output Unit (an abbreviation for *Results Output Unit*) placed in the measurement flow.
- (3) The measurement data is output when the Output Unit is performed and not when the measurement is completed. \*2

1

- \*1 When output control is set to handshaking (data output is controlled by the DSA and GATE signals). For details, refer to *Control Signals and Status Signals* on page 1-13.
- \*2 When handshaking is performed in the output control, the measurement data is held in the Communication module until a data output request (DSA signal) is received from the external device. For details, refer to *Data Output Control with Handshaking* on page 1-25.

#### Precautions for Correct Use

To output data, you must place an Output Unit processing item in the measurement flow. You can place multiple Output Unit processing items in the measurement flow. For details, refer to *Settings Required for Data Output* on page 1-21.

# **1-3-3** Control Methods for the Sensor Controller

There are three methods below to control the Sensor Controller with an external device such as a PLC.

For details of each control method, refer to their corresponding section.

**Control Methods** 

Method	Overview	Trigger type and area	Signal and area to be used
Control signals and status signals		ON/OFF status of the control signals and status signals	Control signals and status signals
Control with com- mands and respons- es	Operation is controlled by send- ing control commands. The re- sults performed by the com- mands can be checked with re- sponses from the Sensor Con- troller.	The control command code is stored in the I/O memory of the PLC and then the Request bit is turned ON.	PLC I/O memory (Command and Re- sponse Areas)
Data output after measurement	After measurement was per- formed, the previously specified measurement data is automati- cally output.	Not required (Automatically out- put after measurement)	PLC I/O memory (Data Output Area)

1. Control with Control Signals and Status Signals (Refer to 1-4-1 Control with Control Signals and Status Signals on page 1-13.)

Control and status check for the Sensor Controller is performed with the ON/OFF status of the control and status signals.

This method is best suited for basic operations such as measurement triggers or for checking the operating status of the Sensor Controller.

External device

Sensor Controller

1

2. Control with Commands and Responses (Refer to 1-4-2 Command/Response Method on page 1-16.)

Control is performed by storing a control command and the response to it to the PLC's I/O memory. This method is best suited to send multiple commands to the Sensor Controller without using exclusive communication instructions for a PLC.

3. Data Output after Measurement (Refer to 1-4-3 Data Output after Measurements on page 1-17.)

After measurement was performed, the previously specified measurement data is automatically output to the PLC's specified I/O memory.

This allows you to output measurement results from the Sensor Controller to the PLC automatically without sending data requests from the PLC.

# 1-3-4 Communication Protocols for Communicating with the Sensor Controller

The Sensor Controller can be controlled using various communication protocols by an external device such as a PLC or a PC.

The communication protocols to control the Sensor Controller by an external device are described below.

# Applicable Communications Protocols

The communication protocols and summary for each communication method available in the Sensor Controller are below.

OK: Supported, - : Not supported

	Communica-		Communication Cable Type		
Communica- tion method	tion Overview protocol		Parallel I/O	Ether- net	RS-232C/ 422 <sup>*2</sup>
Contract input	Parallel	Using a combination of ON and OFF signals of multiple physical contacts ex- changes data between an external de- vice and the Sensor Controller.	ок	-	-
Frame transmission	Non-proce- dure	Without using any specific communica- tion protocol, command frames are sent to the Sensor Controller and response frames are received from it. By sending and receiving data in ASCII or binary formats, data is communicated between an external device such as a PLC or a PC and the Sensor Controller.	-	ОК	ОК

	Communica-		Communication Cable Type		
Communica- tion method	tion protocol	Overview	Parallel I/O	Ether- net	RS-232C/ 422 <sup>*2</sup>
	PLC Link	This is a communication protocol for the OMRON Vision System. Areas for control signals, Command, Response, and measurement data are assigned in the PLC's I/O memory, and data is communicated between the PLC and the Vision System by sharing them cyclically.	-	ОК	ОК
EtherNet/IP	EtherNet/IP	This is an open communication proto- col. Tag data links are used to communicate with the Sensor Controller. Structure variables corresponding to the control signals, command data and re- sponse data, and measurement data are created on the PLC. Those varia- bles are used as tags to input and out- put data via the tag data links to ex- change data between the PLC and the Sensor Controller.*1	-	ОК	-
Data – sharing F	PROFINET	This is an open communication proto- col. Areas for control signals, Command, Response, and measurement data are assigned in the PLC's I/O memory, and data is exchanged between the PLC and the Vision System by sharing the data via IO data CR.	-	ОК	_
	EtherCAT	This is an open communication proto- col. PDO (process data object) communica- tions are used to communicate with the Sensor Controller. I/O ports corresponding to the control signals, command data, response data, and measurement data are prepared in advance, and the variables assigned to the I/O ports are used to input and out- put data via PDO communications to exchange data between the PLC and the Sensor Controller.	-	ОК	-

\*1. When a CJ series PLC is connected, specify each area in the I/O memory.

\*2. FH-1000/2000/3000/5000, and FHV series equip RS-232C only.

# 1-3-5 Saving Sensor Controller Data to an External Device

In addition to sending and receiving data via a communication protocol, you can also save data in the Sensor Controller to an external device using the methods described below. For details, refer to the *Vision System FH/FHV Series User's Manual (Cat. No. Z365)*..

## Connecting the FH/FHV as an External Drive

In addition to the Sensor Controller's built-in RAM disk, you can directly save various types of data such as scene data, scene group data, logged data, and logged images to the external media below.

• For external storage, refer to Using External Storage Devices in the Vision System FH/FHV Series User's Manual (Cat. No. Z365).

Data can be saved directly to a USB memory stick or SD Memory Card inserted into the slot on the Sensor Controller.

• For network drive, refer to the Shared folder on a computer connected to the network in the Vision System FH/FHV Series User's Manual (Cat. No. Z365).

You can save data directly to a shared folder on a computer connected via Ethernet.

• For data transfer (FTP server), refer to the Saving Data to an External Device in the Vision System FH/FHV Series User's Manual (Cat. No. Z365).

You can move logged image files and other data saved in the Sensor Controller's RAM disk or a USB memory stick to a computer via Ethernet.

The computer needs to have an FTP client function to access the Sensor Controller of the FH/FHV series. The computer cannot be accessed directly from the Sensor Controller.

This enables you to move logged images off of the Sensor Controller's RAM disk before it becomes full.

1

For remote operation over a network, refer to the *Remotely Operating the Controller (Remote Operation)* in the *Vision System FH/FHV Series User's Manual (Cat. No. Z365)*.
 If more than one Sensor Controller is connected via Ethernet, a computer (FZ tool) connected to the same Ethernet network can operate and monitor all the Sensor Controllers at once.

1

# 1-4-1 Control with Control Signals and Status Signals

# 1-4 Control Methods Using an External Device

This section describes how to control the Sensor Controller from an external device such as a PLC.

# 1-4-1 Control with Control Signals and Status Signals

Control and status check for the Sensor Controller is performed with the ON and OFF status of the control and status signals.

A PLC inputs measurement triggers or other commands as control signals.

The operating status of the Sensor Controller, judgment results, and other status information can be checked with status signals output from the Sensor Controller.

- (1) The external device turns the STEP signal ON to input a measurement trigger to the Sensor Controller.
- (2) When the Sensor Controller identifies that the STEP signal is turned ON, it outputs the BUSY signal to notify the external device and starts measurement.
- (3) When the Sensor Controller completes the measurement, it outputs the judgment results on the OR signal to notify the external device.

# **Control Signals and Status Signals**

The signal types that are input and output to the Sensor Controller as control and status signals are described below.

# • Input Signals (PLC to Sensor Controller)

Signal	Name	Function
EXE	Control Command Exe-	This is turned ON when the PLC will issue a com-
Command Request	cution Signal	mand to the FH/FHV.
Trigger	Measure Bit	This is turned ON when measurement will be per- formed.
STEP	Measure Bit	This is turned ON when measurement will be per- formed.
DSA (Used only for handshak- ing output control)	Data Output Request Signal	During handshaking, the user (PLC) uses this signal to request to output data output results performed in the measurement flow to external from the Sensor
Result Set Request		Controller of the FH/FHV series.
ERCLR	Frror Clear Bit	This is turned ON when the ERR signal from the
Error Clear		Sensor Controller will be cleared.

Signal	Name	Function
XEXE	Flow Command	This is turned ON when a command will be per-
Flow Command Request	Request Bit	formed while PLC Link, Fieldbus, or parallel flow control is performed.
DI (DI0 to DI7)	Command Input Signals	These are used to input commands from a parallel interface.
ENCTRIG	Encoder Trigger Input (Phase A, B, Z)	This is the encoder input signal. This signal is only available when the encoder trigger will be used.

# • Output Signals (Sensor Controller to PLC)

Signal	Name	Function		
BUSY	Busy Signal	This signal indicates that new requests cannot be accepted because an external input such as a com- mand is currently handled. "ON" of this signal does not mean that a command is currently performed. To check whether a command is being executed, check the Command Completion (FLG) signal.		
FLG	Control Command Com-	The Sensor Controller of the FH/FHV series uses		
Command Completion	pletion Signal	this signal to inform the user (PLC) that a command has been completed.		
GATE	_	This signal informs the user (PLC) of the timing to		
	Data Output Completion	load output data.		
Result Notification	Signal	"ON" of this signal indicates that the Sensor Control-		
		ler is outputting the data. <sup>*1</sup>		
READY	-	This signal indicates that the STEP (Measurement		
Trigger Ready	Camera Image Input Enabled Signal	Trigger) signal or the Trigger signal can be input. <sup>*2</sup> When the multi-input function is used, following STEP signal or Trigger signal is accepted only when this signal is "ON".		
OR	Overall Judgment Output	***		
Total Judgment	Signal	This signal notifies the overall judgment results.*3		
DI (DO0 to DO15)	Data Output Signals	These signals are used to output parallel data and parallel judgment through a parallel interface.		
XFLG	Flow Command	This signal indicates that a command performed		
Flow Command Comple- tion	Completion Bit	while PLC Link or Fieldbus flow control is being per- formed has been completed.		
XBUSY	Measurement Command	This signal indicates that a command input while		
Flow Command Busy	Busy Bit	PLC Link or Fieldbus flow control is being performed is in execution.		
XWAIT	Measurement Command	This signal indicates that a command input can be		
Flow Command Wait Wait Bit		accepted while PLC Link or Fieldbus flow control is being performed.		
Trigger ACK	Trigger Signal Acknowl- edged Bit	This signal indicates that the Sensor Controller of the FH/FHV series has accepted a Trigger signal.		
Command Ready	Command Execution Ready Bit	This signal indicates that a control command is exe- cutable.		

Signal	Name	Function
ERR Error Status	Error Signal	<ul> <li>This signal indicates that the FH/FHV detects the following errors.</li> <li>Camera connection error</li> <li>Battery error</li> <li>Fan error</li> <li>System error</li> <li>Communications timeout</li> <li>STEP input during measurement</li> <li>The ERR signal does not turn OFF even after the error is eliminated. The signal turns OFF only when the error status is cleared by a control command.</li> <li>For details, refer to <i>Error Messages and Troubleshooting</i> in the <i>Vision System FH/FHV Series User's Manual (Cat. No. Z365)</i></li> </ul>
RUN	Measurement Mode Sig-	This is a notification signal indicating the Sensor Controller of the FH/FHV series is in Run mode (In a
Run Mode	nal	measurement capable state with <i>RUN signal output</i> checked in the Layout settings for the currently displayed line).
ACK	Command Completion Flag	This signal indicates that the DI command execution has been completed.
SHTOUT	Exposure Completion Signal	This signal indicates that Camera exposure has been completed.
STGOUT	Strobe Trigger Output	This is the trigger signal for the strobe.

\*1. This signal is linked to the Output Unit processing items in the measurement flow.

This has no linkage relation with the BUSY signal. Also, this has no linkage relation with the OR signal in the parallel communication protocol. Note that the operation is different when PLC Link is used. For details, refer to *2-2 Communicating by PLC Link* on page 2-126.

\*2. This signal is always OFF during display of a through image.

When you use a camera with lighting controller, based on its type and connecting conditions, the time required for the READY or Trigger Ready signal to turn OFF may increase in comparison with not using it.

For details, refer to Camera Image Input FH, Camera Image Input HDR, or Camera Image Input FHV in the Vision System FH/FHV Series User's Manual (Cat. No. Z365).

\*3. The OR signal is output only when the *Output* option is selected in the Adjustment window.

# 1-4-2 Command/Response Method

## Parallel

Commands are input to the Sensor Controller by turning the DI signals (DI0 through DI7) ON and OFF. Since there is no direct response for these commands, so check the ACK signal whether or not a command was accepted.

The command code is input with signals DI0 through DI6, and the command is performed by turning DI7 ON.

DI7 DI6 DI5 DI4 DI3 DI2 DI1 DI0

Execution Command Command information

# • PLC Link, EtherNet/IP, EtherCAT, or PROFINET

By storing control commands from the PLC to the Sensor Controller and responses from the Sensor Controller to the PLC into the PLC's I/O memory, command and response control signals are exchanged. This enables you to control the Sensor Controller using commands such as single measurement and scene switch without any sequence control such as issuing communication commands from the PLC.

### Memory Areas Used by the Command/Response Method

Command Area	You write the control commands to execute for the Sensor Controller to this area.
Response Areas	You read the performed results of the control commands written in the Command Area from this area.

### Flow of Communications between the PLC and the Sensor Controller

- (1) The PLC (the user) writes a control command to a specified PLC's I/O memory area (the Command Area).
- (2) The PLC (the user) then turns the EXE bit ON to send the control command to the Sensor Controller.
- (3) The Sensor Controller perfoms the received control command.
- (4) The Sensor Controller returns a response to the PLC after the control command was performed.
- (5) The PLC (the user) stores the response in a specified PLC's I/O memory area (the Response Area).

The communication commands depend on the communication protocol used. For details, refer to *A-1-3 Command List* on page A-7.

1

# 1-4-3 Data Output after Measurements

# Additional Information

Command-driven character string output is not supported when using EtherNet/IP tag data link communication, EtherCAT, or PROFINET.

To output character strings, use commands equivalent to Non-procedure communication in the EtherNet/IP message communication.

For details, refer to 2-3-19 Communicating with the Sensor Controller using EtherNet/IP Message Communications on page 2-252

## Non-procedure Communications

Communication commands are sent to the Sensor Controller through sequence control in the PLC. An external device and the Sensor Controller communicate through non-procedure (normal) communications.

# **1-4-3** Data Output after Measurements

Just after a Single Measurement or Start Continuous Measurement command is executed, the Sensor Controller automatically outputs the data associated with the measurement specified in advance as output items to the PLC. This allows you to easily pass measurement results data from the processing items to the PLC. You can also choose to output only when the PLC meets the conditions required to receive the data (i.e., when handshaking is enabled).

The output destination for data depends on the protocol that is used to communicate between the external device and the Sensor Controller, as described below.

# • PLC Link, EtherNet/IP, EtherCAT, or PROFINET

The output data is automatically output to the PLC's specified I/O memory below.

### Area of Memory Used for Data Output after Measurements:

### Flow of Communications between the PLC and the Sensor Controller:

The data to output after measurement performed and the PLC I/O memory area (Data Output Area) to store that data need to be specified in advance. For details, refer to *Settings Required for Data Output* on page 1-21.

- (1) Measurement is performed.
- (2) After the measurement was performed, the specified measurement data is stored in the Data Output Area in the PLC.

## Parallel

The data is output to the PLC signal lines via DO signals (DO0 to DO15).

## Non-procedure Communications

The data is output to the PLC reception buffer through non-procedure (normal) communications.

# **Outputting the Measurement Data**

The measurement data is output to the external device via the Communications Module by the processing unit for data output (hereafter, Output Unit) placed in the measurement flow.

Therefore, to output measurement data, you must place an Output Unit in the measurement flow in advance.

The measurement data is output when the Output Unit is performed and not when the measurement has been completed.

You can output character strings read by processing items such as Character Inspection, Barcode, or 2D Code. (Available only for PLC Link and Non-procedure protocols)

Character strings are output simultaneously when the processing item is performed.

### Additional Information

Command-driven character string output is not supported when using EtherNet/IP tag data link communication, EtherCAT, or PROFINET.

To output character strings, use commands equivalent to Non-procedure communication in the EtherNet/IP message communication.

For details, refer to 2-3-19 Communicating with the Sensor Controller using EtherNet/IP Message Communications on page 2-252

# Items that can be Output as Output Data

### Measurement Data

You can output at once up to eight items (32 bytes) with performing one Output Unit.

### Additional Information

- If you need to output nine or more data items, set more than one Output Unit processing unit in the measurement flow.
- For details, refer to *Outputting Multiple Measurement Data Items* on page 1-23 • The number of data items that can be output by one Output Unit can be increased by chang-
- ing a setting when using PLC Link or EtherCAT communications, as shown below.
- PLC Link: 256 max. (1,024 bytes max.)
- EtherCAT: 64 max. (256 bytes max.)

The following items can be output.

- Judgment result
- Measured parameters (correlation values, reference coordinates, etc.)
- · Results calculated based on the values of the measured parameters
- Judgment results for expression results (Parallel Judgment Output)

### • Character Output (Available only for PLC Link and Non-procedure Protocols)

You can output character strings read by processing items such as Character Inspection.

The maximum number of output characters are as follows.

- Character Inspection: 32 characters
- Barcode: 1,024 characters
- 2DCode: 652 characters

- · 2DCode II: 652 characters
- OCR: 128 characters (32 characters x 4 lines)

NULL (\0) is attached at the end of the read string to be output.

The processing items supporting character strings output are listed below.

- Character Inspection
- Barcode
- 2DCode
- 2DCode II
- OCR

For details of the character output format, refer to each processing item description in the Vision System FH/FHV Series Processing Items Reference Manual (Cat. No. Z341).

### **Additional Information**

Command-driven character string output is not supported when using EtherNet/IP tag data link communication, EtherCAT, or PROFINET.

To output character strings, use commands equivalent to Non-procedure communication in the EtherNet/IP message communication.

For details, refer to 2-3-19 Communicating with the Sensor Controller using EtherNet/IP Message Communications on page 2-252

# **Settings Required for Data Output**

Use the following procedures to set up Output Unit for data output.

### Measurement Data

1. **Place the data output processing unit(s) in the processing flow.** Place the processing unit for data output in the measurement flow.

### **Processing Units That Serve as Output Units:**

On the processing item tree in the Flow Editor window, the processing items under *Output result* serve as Output Units.

### **Output Unit Selection:**

Select the Output Units with the following combination according to a communication protocol to be used.

For details of communication protocols, refer to 1-3-4 *Communication Protocols for Communicating with the Sensor Controller* on page 1-9.

OK: Data can be output, - : Data cannot be output.

	Communication Protocol						
Output unit	Parallel	PLC Link	EtherNet/IP	EtherCAT	PROFINET	Non- procedure	
Result Output (I/O)	-	OK	OK <sup>*1</sup>	ОК	ОК	-	
Result Output (Message)	-	-	-	-	-	OK	
Result Output (Parallel I/O)	-	OK	OK <sup>*1</sup>	ОК	ОК	-	
Parallel Data Output	OK	-	-	-	-	-	
Parallel Judgment Output	OK	-	-	-	-	-	
Serial Data Output	-	OK	-	-	-	OK	
Fieldbus Data Output	-	-	ОК	OK	OK	-	

\*1. Except message communications

### Precautions for Correct Use

When Non-procedure UDP is used to output data of *Result output (Message)*, the Sensor Controller outputs the data to only the device whose command was accepted in the end.

### 2. Set the items to output

Set the items to output as output data in the Output Units placed in the measurement flow. For the procedures to set output items in the Output Units, refer to the description for each communication protocol.

### • Character Output (Available only for PLC Link and Non-procedure Protocols)

Perform the character output settings for processing items to read output characters such as Character Inspection.

Since the above processing items perform the character output operation, it does not need to set Output Units in the measurement flow. For the settings to output characters, refer to the description for each processing item in the *Vision System FH/FHV Series Processing Items Reference Manual (Cat. No. Z341)*.

- Character Inspection
- Barcode
- 2DCode
- 2DCode II
- OCR

### **Additional Information**

Command-driven character string output is not supported when using EtherNet/IP tag data link communication, EtherCAT, or PROFINET.

To output character strings, use commands equivalent to Non-procedure communication in the EtherNet/IP message communication.

For details, refer to 2-3-19 Communicating with the Sensor Controller using EtherNet/IP Message Communications on page 2-252

# **Outputting Multiple Measurement Data Items**

# Using Multiple Output Units for Data Output

You can register more than one Output Unit in the measurement flow.

If you want to output different types of data during measurement flow processing, or if you want to output more than nine different data items, you must register multiple Output Units in the measurement flow.

Although data output is performed for each Output Unit placed in the measurement flow, the output destination for the data is the same PLC's I/O memory area (Data Output Area).

Therefore, the first output data is overwritten by the following output data if you do nothing. When you want to save all the output data, take one of the following means.

# • Outputting Data with Result Output (I/O) or Result Output (Message) Processing Unit

The "Result Output (I/O)" or "Result Output (Message)" processing item can output nine or more items by only one processing item.

For details, refer to *Result Output (I/O)* or *Result Output (Message)* in the *Vision System FH/FHV* Series Processing Items Reference Manual (Cat. No. Z341).

# Offsets (Available only for PLC Link Communication Protocol):

When you use multiple Output Units to output data, you can offset the write destination of the output data for each Output Unit.

Set the Offset for the Data Output. For details, refer to 2-2-5 Output Data Settings (Processing Item Registration) on page 2-152.

### **Controlling Data Output with Handshaking:**

When handshaking is used to control data output, the timing of outputting the data is controlled by I/O signals. Therefore, each time that data is output, read and move the data to a different part in the PLC's I/O memory. For details, refer to *Data Output Control with Handshaking* on page 1-25.

# Additional Information

For ASCII data output through Non-procedure communications, you can append a record separator after each output data item. (The default is the delimiter.)

### The following two types of Output Units can be used via parallel communications:

Output unit	Output data
Parallel Data Output	The measurement data is output. Up to eight items can be output.
Parallel Judgment Output	<ul> <li>The judgment results are output. Up to 16 judgment results can be output. The following two types of judgment results can be output.</li> <li>Judgment results for specified processing items.</li> <li>Judgment results of arbitrary judgment conditions set for specified item values</li> </ul>

Parallel Data Output and Parallel Judgment Output Units are output in the order they are processed in the measurement flow.

The items set for output data numbers 0 through 7 via parallel data output are output to the PLC's reception buffer in ascending order, one data item at a time (16-bit units). Each time a data item is output, the GATE signal turns ON. <sup>\*1</sup>

In that time, the first data item output to the PLC's reception buffer (data 0) is overwritten with the following output data item (data 1).

Therefore, the data output to the PLC's reception buffer needs to be moved to the PLC's memory each time the GATE signal turns ON.

\*1: The operation of the DSA signal depends on whether *Handshaking* for output control is enabled. For details, refer to*Data Output Control with Handshaking* on page 1-25.

# Data Output Control with Handshaking

The timing for data output can be controlled through the DSA and GATE signals. As the timing for transferring output data can be controlled, it is useful when output data from multiple Output Units is received.

# Requirements for Using Data Output Control with Handshaking

When controlling data output, set the output control method to *Handshaking* in the communication protocol settings.

For details, refer to Communications Specifications Setting for each communication protocol.

PROFINET Communications:	2-4-6 Communication Specifications Settings on page 2-267

# Handshaking

When when the external device does not turn ON the DSA signal, the measurement data will not be output to the external device from the Sensor Controller. While the DSA signal is ON, the GATE signal turns ON when the measurement data is output from the Sensor Controller.

The external device takes in the measurement data when the GATE signal turns ON.

Signals Used for Handshaking

Signal	Name	Description	
	Data Output Re-	This signal is sent by the external device (PLC) to the Sensor	
DSA	quest Signal	Controller to request data output.	
	Data Output Com- pletion Signal	This signal is sent by the Sensor Controller to inform the external	
GATE		device (PLC) of the timing to load output data. This signal is out-	
		put only when the DSA signal is ON. <sup>*1</sup>	

\*1. When handshaking is not enabled for output control, the GATE signal will also be turned ON when data is output from the Sensor Controller. However, when handshaking is disabled for output control during PLC Link communications, the GATE signal is not even output.

- (1) The PLC turns ON the DSA signal and waits for the output data.
- (2) The Sensor Controller turns ON the GATE signal when the DSA signal is ON and it is ready to output the measurement results.<sup>\*1</sup>
- (3) The Sensor Controller turns ON the GATE signal and outputs the output data.
- \*1. This is when an Output Unit in the measurement flow is performed.

### • DSA Signal ON Timing

The DSA signal needs to be turned ON when data is required.

When an Output Unit has been performed and data to output is ready, the Sensor Controller will output the data when it detected the DSA signal turned ON.

Measurement flow DSA (data output request) signal status

To output measurement results immediately, issue the measurement trigger and turn ON the DSA signal. The Sensor Controller does not check the change from OFF to ON of the DSA signal but checks the ON state. As the measurement results are output from the Sensor Controller to the external device immediately when the Output Unit is performed, the PLC takes in the output data at once.

Measurement flow DSA (data output request) signal status

# Receiving Multiple Continuous Output Data Items

When multiple output data items from multiple Output Units are received, receive the data one at a time using the DSA and GATE signals.

- (1) When the first data is received, the user (PLC) turns ON the measurement trigger and the DSA signal.
- (2) The Sensor Controller turns ON the GATE signal when the DSA signal is ON, and it outputs the first data.
- (3) The user (PLC) turns OFF the DSA signal when the GATE signal turns ON. Then the user (PLC) checks the output data received in the PLC's Data Output Area and moves it to another area in the PLC I/O memory.
- (4) The Sensor Controller checks that the DSA signal is turned OFF and turns OFF the GATE signal automatically.
- (5) The user (PLC) turns ON the DSA signal again after receiving the output data has completed and the GATE signal is turned OFF, and waits for the second data.
- (6) When the second data is output, the second data output is received when the GATE signal is turned ON and step 3 to 5 are repeated.

Step 3 to 5 above are repeated for all subsequent data output items.

# 1-5 Setting Procedures for Communications

This section describes an overview of the setting procedures that the Sensor Controller starts communication with an external device such as a PLC, and the communication modules to be used for the communications.

# Additional Information

For connection with a Touch Panel Monitor, refer to *Settings for Touch Panel Monitor* in the *Vision System FH/FHV Series User's Manual (Cat. No. Z365)*.

# **1-5-1** Communications Setup Procedures

To communicate with an external device, the settings below are configured.

\*1. When performing control through data sharing (data output after measurement).

# 1-5-2 Communications Protocols and Communications Modules

A Communications Module is used to communicate between the Sensor Controller and an external device.

The appropriate Communications Module needs to be previously set for the communication protocol to be used to communicate between the Sensor Controller and the external device.

# • Communications Module Settings

The Communication Module used for communications is selected in the startup settings.

**1** On the Main window, click **Tool** - **System Settings** to open the system settings.

**2** On the Multiview Explorer on the left, select **System settings - Startup - Startup setting** and then click the **Communication** tab.

For details of setting procedures, refer to *Communications Module Settings* for each communications protocol.

# Precautions for Correct Use

After you select the Communications Module to use, save the settings to the Sensor Controller and restart the Sensor Controller.

The selected Communications Module will be enabled after the Sensor Controller restarts. You can then set up the communications.

# • Selecting a Communications Module

Select one of the following Communication Modules based on a combination of the communication protocol used to connect between the Sensor Controller and an external device, and the communication interface.

Communications protocol	Communication inter- face	Communication Module
Parallel	Parallel	Standard Parallel I/O
		Serial (Ethernet)
		PLC Link (SYSMAC CS/CJ/CP/One) (UDP)
	Ethernet	<ul> <li>PLC Link (SYSMAC CS/CJ/CP/One) (TCP)</li> </ul>
	Ethemet	PLC Link (MELSEC QnU/QnAS) (UDP)
PLC Link		PLC Link (MELSEC QnU/QnAS) (TCP)
		PLC Link (JEPMC MP)
	RS-232C/422	Serial - PLC Link (RS-232C/422)
		PLC Link (SYSMAC CS/CJ/CP/One)
		PLC Link (MELSEC QnU/Q/QnAS)
		Fieldbus
EtherNet/IP	EtherNet/IP	EtherNet/IP
		EtherCAT
		PROFINET

Communications protocol	Communication inter- face	Communication Module	
		Serial (Ethernet)	
		Non-procedure (UDP)	
	Ethernet	Non-procedure (TCP)	
		Non-procedure (TCP Client)	
Non-procedure		<ul> <li>Non-procedure (UDP) (Fxxx series method)</li> </ul>	
	RS-232C/422	Serial (RS-232C/422)	
		Non-procedure	
		Non-procedure (Fxxx series method)	

# 1-6 Differences in Specifications Based on the Communications Protocol

This section describes the types and differences of communication protocols that are used for communications with the Sensor Controller.

# 1-6-1 List of Supported Signals by Communications Protocol

Some of the control and status signals to be used depend on the communication protocol as shown below.

The table below can be used to check which *signals exist in each communication protocol* by means of a vertical arrangement.

Note that this table does not indicate whether signals of one communication protocol can be used simultaneously with signals of other communication protocols.

For restriction on communication protocols that can be used simultaneously, refer to 1-6-2 Restrictions when Using Different Communication Protocols Simultaneously on page 1-33.

# **Precautions for Correct Use**

The control signals and status signals cannot be used for control in Non-procedure communications.

# • Input Signals (PLC to Sensor Controller)

OK: Can be used, - : Cannot be used

		Signals for each communication protocol

SHTOUT	Exposure Comple- tion Signal	ОК	-	-	ОК	-
STGOUT	Strobe Trigger Out- put	ОК	-	-	-	-

\*1. This will not be detected while commands received through any other protocol are processed. The BUSY signal in Parallel can be shared in all protocols. If you use more than one protocol and need to detect command execution, use the BUSY signal in Parallel.

- \*2. Data is not output when there is no handshaking used in PLC Link.
- \*3. The OR signal is unavailable in PLC Link.
- \*4. The one-shot OR signal is only available in Parallel.

1

1 Overview

# 1-6-2 Restrictions when Using Different Communication Protocols Simultaneously

The FH/FHV series can use different communication protocols together. Restrictions in combined use are as follows:

- The Parallel Communication Module can be used with any other Communication Modules.
- Communication Modules other than the Parallel ones have the following restrictions in the combination.

PLC Link for Vision Systems is unavailable simultaneously with Ethernet and RS-232C/422.

PLC Link for Vision Systems is unavailable simultaneously with EtherNet/IP, EtherCAT, and PROFI-NET.

PROFINET is unavailable simultaneously with other non-procedure protocol using Ethernet. All combinations of Communication Modules other than above are available.

# Precautions for Correct Use

If control signals or commands are input simultaneously to the Sensor Controller from different Communications Modules, they may not be received correctly. Check the status signals for each Communications Module and input control signals and commands at different times for each.

# **1-6-3** Restrictions in Communication Protocols by Operation Mode

The Sensor Controller for the FH/FHV series can select its operating mode. The following describes typical restrictions for each operating mode.

For details, refer to Setting Operation Mode in the Vision System FH/FHV Series User's Manual (Cat. No. Z365)..

### Double Speed Multi-input Mode

- To use the Multi-input function, use Parallel or EtherCAT in which the state of the READY signal can be checked. For EtherCAT, check the Trigger Ready signal instead of the READY signal.
- While the Multi-input function is used, most of the CPU's loads are assigned to measurement processing. Therefore, its performance might drop (response may be delayed or packets lost) or communications errors might occur. While the Multi-input function is used, do not use EtherNet/IP or PROFINET communication protocols.
- If triggers are continuously inputted with speed that communication outputs will not be in time, it may cause STEP not to be output or measurements to be delayed. Be sure to input triggers with the timing at which communications delay will not occur.

### Multi-line Random-trigger Mode

- Only Line 0 is available in Non-procedure or PLC Link.
- Depending on communication protocols, each line needs to be set.
- For Parallel communications, the I/O function and terminals vary depending on the number of lines. This function is not supported by FHV series.
- Non-stop Adjustment Mode
  - Communication commands accepted during non-stop data transfer are only the Measurement command mand (in Parallel, Non-procedure, and PLC Link) and Continuous Measurement command (only Parallel).

# **1-6-4** Models being Compatible with Communication Protocol

This section describes external devices which can communicate with the FH/FHV series based on communication protocols.

# • PLC Link and NGn-procedure Communications

# **2-1 EtherCAT Connections**

This section describes the communication settings, communication specifications, input/output formats, and the communication timing chart required for communications by EtherCAT between the Sensor Controller and an external device.

# 2-1-1 Introduction to EtherCAT

EtherCAT (Ethernet Control Automation Technology) is a high-performance industrial network system that enables faster and more efficient communications based on Ethernet.

Each node achieves a short communication cycle time by transmitting Ethernet frames at high speed. Although EtherCAT is a unique communication protocol, standard Ethernet technology is used for the physical layer, which means you can use Ethernet cables for wider applications.

And the effectiveness of EtherCAT can be fully utilized not only in large control systems that require high processing speeds and system integrity, but also in small and medium control systems

# How EtherCAT Works

In EtherCAT communication, Ethernet frames pass through all of the slave nodes.

When a frame passes through a slave node, the slave node reads and writes the data in the area that is allocated to it in the frame in a few nanoseconds.

The Ethernet frames that are transmitted by the EtherCAT master pass through all EtherCAT slaves without stopping. The last slave returns all of the frames, which again pass through all of the slaves before returning to the EtherCAT master.

This mechanism ensures high speed and real-time data transmission.

Ethernet frames

The data exchanges that are cyclically performed between the EtherCAT master and EtherCAT slaves use *EtherCAT telegrams* that are stored directly in the Ethernet frames.

Each *EtherCAT telegram* consists of a telegram header (including the data length and one or more slave addresses), data, and a working counter (i.e., check bits).

WKC: Working counter

# **Types of EtherCAT Communications**

The following 2 types of communications are available with EtherCAT.

PDO communications are processed in each EtherCAT communication cycle to refresh data continuously. SDO communications are processed between PDO communications.

# • Process Data Communications (PDO Communications)

The process data communication function (PDO communications) cyclically transfers process data in real-time.

The EtherCAT master maps the logical process data space to the nodes to achieve cyclic communications between the EtherCAT master and slaves.

# • Mailbox Communications (SDO Communications)

The mailbox communication function (SDO communications) is used to perform message communication.

Whenever necessary, the EtherCAT master sends a command to a slave, and then the slave returns a response to the EtherCAT master.

The mailbox communication function (SDO communication) has the following functions.

- · Reading and writing process data
- · Setting slaves
- Monitoring slave status

2

# 2-1-2 Structure of CAN Application Protocol over EtherCAT (CoE)

EtherCAT allows the use of multiple protocols for communication. EtherCAT slave terminal adopts *CAN application protocol over EtherCAT (CoE)* as a device profile for *CAN application protocol* which is one of the open network standards, which provides the communication interface to apply to Ether-CAT devices.

The following figure indicates the CoE structure in the EtherCAT coupler unit.

The object dictionary for the CAN application protocol is roughly classified into PDOs (process data objects) and SDOs (service data objects).

PDOs consist of the mappable object dictionaries, and the contents in process data are defined by the PDO mappings. PDOs are used for PDO communications to exchange process data periodically.

Moreover, SDOs can read and write all object dictionaries and are used for non-periodic SDO (eventdriven message) communications.

In EtherCAT, by setting the object dictionaries for PDOs and SDOs using the CoE interface, EtherCAT devices that have the same device profiles as the CAN application protocol can be provided.

# 2-1-3 EtherCAT Slave Information Files (ESI Files)

The setting information for an EtherCAT slave is provided as ESI file (EtherCAT Slave Information). In EtherCAT, its various communication settings are defined based on the ESI definition information and the network connection information for the connected slaves.

Installing ESI files into the network setup software (configuration tool) can generate the network configuration information. <sup>(\*1)</sup>

Downloading the generated network configuration information to the EtherCAT master enables you to setup the EtherCAT network.

ESI files for the FH/FHV can be downloaded from the OMRON website.

\*1: If you are using Sysmac Studio, it is not necessary to install the ESI files in the network setup software (configuration tool). The ESI files for OMRON EtherCAT slaves have already installed in the Sysmac Studio. Auto-update function in the Sysmac Studio enables you to get the ESI files for the latest models.

2

# 2-1-4 Transitions of Communications States

The EtherCAT master controls the state transition model for communication control of its slave terminals.

The following figure indicates the transition for the communication state since the power has been turned ON.

The following table indicates whether or not data objects can be sent or received in each communication state.

Status	SDO commu- nications	Sending PDOs	Receiv- ing PDOs	Description
Init.	Not possi- ble	Not possi- ble	Not possi- ble	Communications is in initialization. Communica- tions are not possible.
Pre-Operational (Pre- Op)	Possible	Not possi- ble	Not possi- ble	Only SDO (message) communications are pos- sible. After the initialization, the network settings is ini- tialized in this state.
Safe-Operational (Safe-Op)	Possible	Possible	Not possi- ble	Sending PDOs in addition to SDO (message) communications are possible in this state. The slave terminals can send Information such as status with sending PDOs.
Operational (Op)	Possible	Possible	Possible	Normal state in communications. The I/O data can be controlled with PDO com- munications.

# 2-1-5 Process Data Objects (PDOs)

This section describes the process data objects (PDO) used in EtherCAT communications.

# Introduction

Real-time data transfer in cyclic communication uses Process Data Objects (PDOs). There are two types of Process Data Objects (PDOs): RxPDOs, which are used by the EtherCAT slave terminal to receive data from the EtherCAT master; and TxPDOs, which are used by the Ether-CAT slave terminal to send data to the EtherCAT master.

The EtherCAT application layer can hold more than one object to enable the transfer of various process data of the EtherCAT slave terminal.

The contents of the process data is defined in the *PDO mapping objects*. EtherCAT slave terminals support PDO mapping for I/O control.

2

2-1-5 Process Data Objects (PDOs)

# PDO Mappings

PDO mapping objects contain the I/O data for EtherCAT slave terminals. PDO mapping objects are managed with indexes in the object dictionary: from 1600 to 17FF Hex for the RxPDO, and from 1A00 to 18FF Hex for TxPDO.

# PDO Mapping Scheme in EtherCAT

The following describes the PDO mapping scheme in EtherCAT.

Three application objects (Object A, B, and D) are allocated to the PDO (name: PDO\_1) at index 1ZZZ Hex.

Like mentioned above, PDO mappings indicates how application objects are allocated to PDOs. Indexes and sub-indexes are also allocated to application objects.

	Objec	t Dictiona	iry			
oject	Index	Sub Index	Object Content	ts		
jo br	1ZZZ hex	01 hex	6TTT hex TT hex	8		
Mapping object		02 hex	6UUU hex UU hex	8		
Σ		03 hex	6YYY hex YY hex	16		
			PDO-Length : 32	Bit	<u>↓</u> ,	
					PDO_1 Object A Object B Object D	
	6TTT hex	TT hex	Object A			
ರ	6UUU hex	UU hex	Object B			
obje	6VVVHex	VV hex	Object C			
ation	6YYY hex	YY hex	Object D			
Application object	6ZZZHex	ZZ hex	Object E			
Ą					1	
					1	
		1	1			

# • PDO Mapping for EtherCAT Slave Terminals

EtherCAT slave terminals have PDOs for each EtherCAT coupler unit and the Sensor Controller for FH/FHV series.

Application objects are allocated by default (factory settigs) to PDOs for each unit.

The following figure describes a specific example for one of PDOs in a Sensor Controller for the FH/FHV series.

In the above example, a single application object is allocated to the PDO at index 1BFF Hex (name: 512th transmission PDO mapping). This PDO is for TxPDO. The application object contains the Sysmac error status at index 2001 Hex and sub-index 01 Hex.

# **Allocating PDOs**

# Scheme for Allocating PDOs to EtherCAT Slaves

Multiple PDOs can be allocated to an EtherCAT slave. The following example indicates the PDO allocation.

Here, PDOs are allocated to index 1C12 Hex for the RxPDO, and 1C13 Hex for the TxPDO.

In the example, three PDOs (PDO A, PDO B, PDO D) are allocated to index 1C13 Hex for the TxPDO.

Likewise, a PDO for the RxPDO is also allocated to index 1C12 Hex.

The above allocation defines the PDO types for communications between the EtherCAT master and slave.

### 2-1-6 Service Data Objects (SDOs)

This section describes the service data objects (SDO) used in EtherCAT communications.

# Introduction

EtherCAT slave terminals support SDO communications.

The EtherCAT master can set parameters and monitor status by reading and writing data from and to entries in the object dictionary using SDO communications.

For the objects that SDO communications are available, refer to *2-1-27 Object Dictionary* on page 2-87.

# Abort Codes

The following table lists the abort codes for SDO communication errors.

Abort code value	Meaning
05030000 Hex	Toggle bit not changed
05040000 Hex	SDO protocol timeout
05040001 Hex	Client and server command specifiers not valid or unknown
05040005 Hex	Out of memory area
06010000 Hex	Unsupported access to an object
06010001 Hex	Attempt to read a write-only object
06010002 Hex	Attempt to write to a read-only object
06020000 Hex	Non-exist object in the object dictionary
06040041 Hex	Unable to map the object to the PDO
06040042 Hex	Number and length for the mapped object exceed the PDO length.
06040043 Hex	General parameter incompatibility
06040047 Hex	General internal incompatibility in the device.
06060000 Hex	Access failure due to a hardware error.
06070010 Hex	Mismatch of data type and service parameter length
06070012 Hex	Data type mismatch and service parameter length is too long.
06070013 Hex	Data type mismatch and service parameter length is too short.
06090011 Hex	Missing sub-index.
06090030 Hex	Parameter value is out of range. (Only for write-access)
06090031 Hex	Written parameter value is too high.
06090032 Hex	Written parameter value is too low.
06090036 Hex	Maximum value is smaller than minimum value.
08000000 Hex	General error
08000020 Hex	Data cannot be transferred or stored to the application.
08000021 Hex	Data cannot be transferred or stored to the application because of local control.
08000022 Hex	Data cannot be transferred or stored to the application because of the present device
	state.
08000023 Hex	Failed to dynamically create the object dictionary, or no object dictionary exists.

### 2-1-7 Communications between Master and Slaves for EtherCAT

This section describes the communication modes between the master and slaves for EtherCAT and the communication modes for EtherCAT slave terminals.

# Communication Modes for Communications between Master and Slaves for EtherCAT

#### • Free-run Mode (FH/FHV series not supported)

In the free-run mode, a slave performs the I/O processing (updating the I/O data) asynchronously to the communication cycle of the master.

### • DC Mode

In the DC mode, a slave performs the I/O processing (updating the I/O data) synchronously with the communication cycle of the master. The synchronization in EtherCAT communications uses a distributed clock (DC) to share the same clock in the master and slaves. Interruptions (Sync0) are generated in the slaves at precise intervals based on the clock. Each slave performs the I/O processing at the precise timing.

# **Communication Modes for EtherCAT Slave Terminals**

The FH/FHV series support DC mode. They do not support the free-run mode.

# **Communication Cycle**

The communication cycle is determined by the settings for it in the EtherCAT master. For details of communication cycle supported by the built-in EtherCAT port in the NJ series CPU units, refer to *NJ-series CPU Unit Built-in EtherCAT Port User's Manual (Cat. No. W505)*.

# 2-1-8 Communication Method of FH Sensor Controller Connected by EtherCAT

With commands and responses via communications between an EtherCAT master and a Sensor Controller, the master can control the Sensor Controller and make it output data after measurement. To connect a Sensor Controller of the FH series to an NJ series CPU unit by EtherCAT, use Sysmac

Studio (standard edition) version 1.09 or later.

Using the Sysmac Studio, the Sensor Controller of the FH series is registered to the EtherCAT slave configuration on the Edit Network Configuration tab page.

For details of the registration procedures, refer to *Controller Configurations and Setup* in the *Sysmac Studio Version 1 Operation Manual (Cat. No. W504).* 

### Precautions for Correct Use

When Sysmac Studio is used in a high load environment, such as input of measurement triggers at short intervals while connected online to an FH, there may be deviations in the measurement processing time.

### Additional Information

Up to eight Sensor Controllers of the FH series can be connected to an NJ-series Controller by EtherCAT.

In EtherCAT communications, communications are performed via I/O ports in the following six areas in the Controller. The I/O ports in the Sysmac Error Status Area are used only when a CPU Unit of the NJ series is connected as a EtherCAT master.

	(1) I/O ports in the	These I/O ports are used that you write control com-
Command/recence	Command Area	mands to perform for the Sensor Controller.
Command/response method	(2) I/O ports in the Response Area	These I/O ports are used that the Sensor Controller writes the results which the control commands written in the Command Area were performed.
Data output after measurements	(3) I/O ports in the Data Output Area	These I/O ports are used that the Sensor Controller writes the measurement parameters, judgment results, and other results after measurements are performed.
Error status	(4) I/O ports for Sysmac Error Status Area	These I/O ports are used that the Sensor Controller writes the error status. Valid only for Sysmac Studio and Vision Tool used together.
	(5) I/O ports in the user input area	These I/O ports are used that you write the data that you defined for the Sensor Controller.
User area	(6) I/O ports in the user output area	These I/O ports are used that the Sensor Controller write the data that you defined for the Sensor Control- ler.

\*1: You can use output controls (handshaking) to prevent output data from being externally output from the communications buffer until the Controller (master) turns ON the Result Set Request signal to request the output data.

\*2: For details of the Output Units outputting measurement data, refer to *Settings Required for Data Output* on page 1-21.

\*3: Use the Macro Customization Function to input and output to the User Area. For details of the Macro Customization Function, refer to *EtherCAT communication of the IO Module List* in the *Vision System FH Macro Customize Functions Programming Manual (Cat. No. Z367).* 

# **Communications in Multi-line Random-trigger Mode**

In Multi-line Random-trigger mode, a Sensor Controller for the FH series can control up to eight lines. In Multi-line Random-trigger mode, the I/O ports (areas) for communications between the Sensor Controller and the master are allocated as shown below.

	I/O ports in the Command Area	
Command/response method	I/O ports in the Response Area	
Data output after measurements	I/O ports in the Data Output Area	Allocated for each line.
	I/O ports in the User Input Area	•
User area	I/O ports in the User Output Area	
Error status	I/O ports for Sysmac Error Status	The same for all lines.
Error status	Area	

Independent areas for PDO communications are allocated for each line by allocating a Module (line) to each EtherCAT communication slot using Sysmac Studio (standard edition).

### Available Size for Output Data

The upper limits for the output data size depend on the number of lines and User Area to be used as shown below.

Number of lines	Not Using User area	Using User area
1 line	Max. 256 bytes	Max. 256 bytes
2 lines		
3 lines		
4 lines		
5 lines		Max. 128 bytes
6 lines	Max. 128 bytes	
7 lines		
8 lines		

### • Minimum PDO Communication Cycle Time

Do not set the communication cycle (PDO communication cycle time) for EtherCAT communications to a value lower than the minimum time in the following table.

The minimum communication cycle time (PDO communication cycle time) depends on the number of lines to control, the number of bytes for output data, and the User Area to use as shown below. In Multi-line Random-trigger mode, the minimum value for the communication cycle is the minimum value for the maximum byte size for each line.

If the communication cycle (PDO communication cycle time) were set lower than the minimum value below, a slave application error (AL status code: 0x0035) will occur and EtherCAT communication will become unavailable.

Number of lines to	Byte size of output data			
be controlled	32 bytes	64 bytes	128 bytes	256 bytes
1 line	125 µs			250 µs
2 lines	250 µs			
3 lines	250 µs		500 µs	
4 lines	500 µs			
5 lines	500 µs			1000 µs
6 lines	500 µs		1000 µs	Unavailable
7 lines	500 µs		1000 µs	Unavailable
8 lines	1000 µs			Unavailable

#### Not Using User area

#### Using User area

Number of lines to	Byte size of output data			
be controlled	32 bytes	64 bytes	128 bytes	256 bytes
1 line	125 µs		250 µs

### 2-1-9 Communications Settings

. . . The communication method to be used is determined by select-1. Communication Moding a communication module. ule settinas For details, refer to 2-1-10 Communications Module Settings (Startup settings) (Startup Settings) on page 2-22. Т The communications specifications are set for the communications method of the Communication Module selected in step 1. 2. Communications Moreover, The data size settings output to the Data Output Area specifications settings and whether or not to use the User Area are also set. For details, refer to 2-1-11 Communication Specifications Settings on page 2-23. ↓ . . . The data output to the Data Output Area is registered in the Output Unit. 3.Output data settings The Output Unit is placed in the processing flow in the same way (processing item regisas for other processing items. tration) For details, refer to 2-1-12 Output Data Settings (Processing Item Registration) on page 2-28. Т Using Sysmac Studio, register Sensor Controllers of the FH/FHV series in the EtherCAT slave configuration. 4. EtherCAT network Moreover, When multiple lines are used in Multi-line Randomconfiguration settings trigger Mode, set the Communication Module for each line. For details, refer to 2-1-14 EtherCAT Network Configuration Settings on page 2-37. ↓ In normal communication state, ECAT RUN-LED on the Sensor Controller lights green. If communications were not working properly, check the communications setup from step 2. 5. Communications test If communications were not performed properly, error events are registered in the troubleshooting of the Sysmac Studio. Check them to solve the problem. For details, refer to 2-1-15 Communication Test on page 2-38.

The following settings are required to use EtherCAT communications.

### 2-1-10 Communications Module Settings (Startup Settings)

- **1** On the Main window, click **Tool System Settings** to open the system settings.
- **2** On the Multiview Explorer on the left, select **System settings Startup Startup setting** and then click the **Communication** tab.

System Settings	Language Setting	Basic	Communication	Operation mode
Startup setting     Camera     Camera     Camera	Communication mod	ule select —		
<ul> <li>Inter-camera setting</li> <li>Output signal setting</li> </ul>	Serial(Ethernet)	Norr	nal(UDP)	•
- Communication	Serial(RS-232C/422	) Norr	nal	-
Parallel RS-232C/422(Normal)	Parallel	Stan	dard Parallel I/O	•
Ethernet(Normal(UDP)) EtherCAT	Fieldbus	Ethe	rCAT	<b>_</b>
	Remote Operation	ON		

- **3** In the Communication Module Selection Area, select *EtherCAT* in the *Fieldbus*, and then click **Apply**.
- **4** Click **Data save** in the Toolbar.

Data save

- **5** On the Main window, click **Function System restart**.
- 6 Click OK in the System restart dialog box to restart the Sensor Controller. When the Sensor Controller was restarted, the set Communication Module will operate with the default settings.

**7** Set the IP address and other parameters for external devices such as a PLC.

#### Precautions for Correct Use

If you will use the Multi-line Random-trigger mode for EtherCAT communications for multiple lines, use the following procedure to set the Communications Module.

- (1) In the Communications Module settings for line 0, set the *Fieldbus* Box to *EtherCAT*, save the setting to the Vision Sensor, and then restart the system.
- (2) After the system has been restarted, set the *Fieldbus* Box to *EtherCAT* in the Communications Module settings for line 1, save the setting to the Vision Sensor, and then restart the system. Repeat this step for the rest of the lines.

### Additional Information

You can save the Communication Module settings to a file. Use the *System data* or *System* + *Scene group 0 data* option for *saving settings to a file*. For details, Refer to *Saving Settings Data to the Controller RAM Disk or an External Storage Device* in the *Vision System FH/FHV Series User's Manual (Cat. No. Z365)*.

### 2-1-11 Communication Specifications Settings

Here, set output data size, output handshaking, and output controls to perform EtherCAT communications.

### **Precautions for Correct Use**

- Use the same communications specifications settings for the Sensor Controller and the external device.
- Do not input signals to EtherCAT from an external device while performing the EtherCAT system settings.
- Before you set the communications specifications, set the Communications Module to *EtherCAT*.

Restart the system after you save the data to the Vision Sensor. For details, Refer to 2-1-10 Communications Module Settings (Startup Settings) on page 2-22.

- **1** On the Main window, click **Tool System Settings** to open the system settings.
- **2** Select **System Settings** and then select **Communications EtherCAT**. Communication settings window appears.
- **3** Set each item.

\*1. When you control six to eight lines in Multi-line Random trigger mode, you cannot use the output data size of 256 bytes.

### Click Apply.

#### **Precautions for Correct Use**

If you change any of the *Line N Data Output Number* and *User area* settings, restart the Controller.

#### Additional Information

If you use alignment, select the data type of the output data according to the application. • DINT Data:

- This data type holds a single-precision floating-point number. Coordinate values are multiplied by 1,000 and are output as integers. Only 1/1,000 of the precision is output.
- LREAL Data:

This data type holds a double-precision floating-point number.

If you use alignment, coordinate values are output as double-precision floating-point numbers.

This allows you to output the actual values to an external device.

However, processing 64-bit calculations on the NJ-series Controller or other PLC will be slower than processing 32-bit calculations.

ByteArray Data:

This is used to output a character string. (Other than characters cannot be output.)

- 1) Select *Result Data Format* on the EtherCAT setting screen in the Sensor Controller of the FH/FHV series. (Data with *Array of Byte* format is output to the NJ series Controller.)
- 2) Use the *AryToString* command in the program on the NJ series Controller to convert the received data with *Array of Byte* format to *String* format.

# EtherCAT Communications Settings for Multi-line Random-trigger Mode

When you use Multi-line Random-trigger mode to perform EtherCAT communications on multiple lines, you can only configure EtherCAT communication settings on line 0 Setting tab page. The EtherCAT communication settings on multiple-line are as follows.

Setting item	Description
Output control	Common settings for all lines
Output period	Common settings for all lines
Output setting	Set for each line.
	The settings of the Fieldbus data output for each line vary depending on
	the settings of the number of Data Output.
	For details, refer to 2-1-12 Output Data Settings (Processing Item Regis-
	<i>tration)</i> on page 2-28.

### 2-1-12 Output Data Settings (Processing Item Registration)

Here, set the output items and output format to be used with EtherCAT. This processing item is not available in the FHV series. When you set output data in the FHV series, refer to 2-1-13 Setting Output Data (Numerical Values/Character Strings) on page 2-31.

### **Registering Processing Items**

Register the processing items for data output in the measurement flow.

- 1 Click **Edit flow** in the Toolbar.
- 2 Select the Fieldbus Data Output processing item in the processing item tree.

📮 💼 Output result			
🛄	Data Output		
🗵	Parallel Data Output		
🌆	Parallel Judgement Output		
📓	Fieldbus Data Output		

### **3** Click **Append**.

The Fieldbus Data Output processing item is added at the bottom of the unit list (flow).

Click the Fieldbus Data Output a icon and set the data output items and data format.
 For details of the settings, refer to the following.
 Setting the Output Data on page 2-29

#### Precautions for Correct Use

#### Fieldbus Data Output

Perform the communication settings before the settings of Fieldbus Data Output. Note that if you changed the communication settings after the settings of Fieldbus Data Output, the changed settings will not be displayed on the Fieldbus Data Output setting display.

2 Methods for Connecting	and Communicating	with External Devices

#### Additional Information

• Depending on the Data Output Number setting for the line, you can set from 4 to 64 data items for output with one data output processing item.

Examples:

DINT16: You can register up to 16 data items.

LREAL 24: You can register up to 24 data items.

For the number of data items that you can output for each Data Output Number setting., refer to 2-1-11 Communication Specifications Settings on page 2-23.

If you need to output more data items than given above, use more than one Output Unit. However, the data is output to the same destination, so if you do not control the output, the data that was output first will be overwritten by the subsequent data.

Use the following method to read each set of output data.

Controlling Data Output with Handshaking

When handshaking is used to control data output, the timing of outputting the data is controlled by I/O signals.

Each time that data is output, read the output data and move it to a different part of I/O memory in the PLC.

For more information on handshaking, refer to *Data Output Control with Handshaking* on page 1-25.

• Data is output in the order of registration in the measurement flow, with each data output processing item executed at a different timing. (Data output is executed in the order that it is registered in the measurement flow.)

For details, refer to Outputting the Measurement Data on page 1-18.

## Setting the Output Data

Set the output data with expressions.

Set the expression for each four-byte data (DINT) and eight-byte data (LREAL).

#### Additional Information

The Fieldbus Data Output setting item changes according to the EtherCAT communications settings. Set the total output data size (256 bytes max.) and the number of data items to output (64 max.) in the EtherCAT communications settings in advance.

**1** Click the Fieldbus Data Output I icon in the measurement unit list (flow).

**2** The Fieldbus Data Output window is displayed.

The **DINT Setting** and **LREAL Setting** tabs and the number of the output data are displayed according to the EtherCAT communication settings.

3 In the item tab area, click either tab, DINT Setting or LREAL Setting. The DINT Setting and LREAL Setting tabs are displayed according to the EtherCAT communication settings.

.Fieldbus Data Outp	put	
DINT Setting	LREAL Setting	
	I	
Output data —		
No. Comme	ent Expression	<u> </u>
0		
2 3		-
4		
5		<b>_</b>
6	×	
No. 0	Comment view	
Comment:		_
Expression :		
	2222	-
Result : 0.	.0000	

The selected output data number is displayed under the list.

**5** Click mext to the expression text box and set the expression.

Specify the processing items, measurement results, and measurement data in the expression. Arithmetic or function calculations can be applied to the measurement data to output. For details of the calculation settings, refer to *Calculation* in the *Vision System FH/FHV Series Processing Items Reference Manual (Cat. No. Z341).* 

- 6 Click for the **Comment** text box and enter the description for the expression. The entered comment will be displayed in the detailed results area on the Main window. For example, *Test* was entered as the comment for the expression 0, *Test* will be displayed instead of *Expression 0* in the detailed results areas on the Main window.
- **7** Repeat step 4 to 5 to set expressions for each output data number.
- **8** In the item tab area, click either tab, **DINT Setting** or **LREAL Setting** and set the expressions in the same way as for step 3 to 5 above.

#### Additional Information

If you delete one of the expressions that is set for an output data number, 0 is output for the output data for that number.

### 2-1-13 Setting Output Data (Numerical Values/Character Strings)

# **Registering Processing Items**

Register the processing items for data output in the measurement flow.

1 In the Main window, click **Edit flow** in the Toolbar.

### 2

Click Result output (I/O) in the processing item tree.

### **3** Click **Append**.

The Result output (I/O) processing item is added at the bottom of the unit list (flow).

4 Click **Result output (I/O)** icon in the unit list (flow) or **Set** to set the output device and the output data.

# Setting the Output Device

Here, set a communication method when data is output.

1 Click **Result output (I/O)** icon in the unit list (flow) or **Set** to set the output device and the output data.

The Result output (I/O) setting window is displayed.

0	1. Result output (I / O) - C ×					<	
	Output setting						
N	o. Offset	Data Type	Data	Value	Title		
0							
	▲ ▼ Insert	Delete	Edit				
						~	
					ок	Cancel	

### 2 Click Output setting.

The Output setting window is displayed.

Output setting		
Output device : Not selected		~
	ок	Cancel

**3** Click at the right side of the **Output device** text box to select the communication method to use.

Output setting		
Output device :	Not selected ~	1
	Not selected Serial(Ethernet) Serial(RS-232C/422)	
	Fieldbus	

2-1-13 Setting Output Data (Numerical Values/Character Strings)

#### **Precautions for Correct Use**

- The displayed output device is determined based on the selection of Communication module in the System settings in the item tab.
- Executing measurements without an output device selected causes a failure (NG: No measurement) in the judgment of the processing unit.

# Setting the Output Data

Here, set the data to output such as processing item data or fixed character strings.

1 In the item tab area, click **Output data**.

The Result output (I/O) setting window is displayed.

👩 1. Res	ult output (I / O)					
Out	outsetting					_

a) Setting data display area

The No. (output number), Offset (indicating the byte position from the beginning), Data type (integer, double, string), Data, Value, and Title (data description) are displayed in this area. A value is displayed when a variable is assigned to data.

b) Output data display area

Contents in the output data display area in binary (Hex) are displayed in this area.

c) Button

Button	Description
	Moves the selected data up one position.
•	Moves the selected data down one position.
Insert	Adds new data to the selected data position.
Delete	Deletes the selected data. The following data moves up after the deletion.
Edit	Edits the selected data.

Button	Description
ОК	Saves the current settings and returns to the previous view.
Cancel	Discards the current settings and returns to the previous view.

2 In the list, select the output data number to set the output and then click **Insert**. The following **Output data editing** dialog box is displayed.

Output data editing			
Data Type	Data	Title	
	~	- Agg	
String setting			_
Siz	e: 10 -		
Character code	e: 0 -		
	When using languag	e dependent characters, please specify the code page according to that language.	
			4
		OK Cance	I

Setting item		Setting value [Factory default]	Description
• In		integer	
Data	a type	Double	Sets the data type.
		String	
			There are two input methods. <sup>*1</sup>
Data	a	-	Enter strings directly
			Assign variables
Title		-	Enters the description for data.
Strir	ng settings		Valid when String is selected in the Data type.
	Size	0 to 4,095	Sets the number of characters.
	Size	[10]	
	Character code	[0]	Sets the code page according to the language to be used.

\*1. Any arithmetic expression cannot be used. If it is used, it will be handled as character strings.

• Character code: Specify the following code page for each language.

Language	Code page	Language	Code page	Language	Code page
Japanese	932	English	1252	Chinese (simplified)	936
German	1252	French	1252	Chinese (traditional)	950
Italian	1252	Spanish	1252	Korean	949
Vietnamese	1258	Polish	1250		

• The default 0 is no language-dependent letters in ANSI code page.

• If non-existing code page is selected, corresponding data is handled as invalid data (NULL).

**3** Click at the right side of the **Data type** text box to select the data to output. *Integer, Double,* or *String* are selectable.

Data type	Description
Integer	<ul> <li>Entered data is handled as four-byte data.</li> <li>Allowable entering range is a range of signed INT.</li> <li>When string variables are specified for data, character strings like digits which can be converted into numerical values will be converted and output.When decimal digits are included, they are truncated.Moreover, they are handled as "0" if they are not convertible.</li> </ul>
Double	<ul> <li>Entered data is handled as eight-byte data.</li> <li>The allowable entering range is a range of eight-byte floating decimal value.</li> <li>When string variables are specified for data, character strings like digits which can be converted into numerical values will be converted and output. Moreover, they are handled as "0" if they are not convertible.</li> </ul>
String	<ul> <li>Entered data is set based on specified <i>Size</i>. Example: Size is four and the entered data is ABCD. ABCD → ABC+NULL</li> <li>The number of allowable entering characters is up to 4,095. If this limit is exceeded, nothing is displayed and output.</li> <li>When NULL is included in the entered character string, the character string following NULL is not output.</li> <li>The following escape sequence codes can be entered. The entered escape sequence codes are handled as fixed character strings. N: Carriage return, \r: Line feed, \t: Tab, \xXX: ASCII code specified by "XX" (numerical value), \": Double quotation mark, \\: Backslash</li> </ul>

4 Enter data into *Data* text box.

Data that can be output with one data No. is a range only to be handled as one string.

- When directly entering an output content into the **Data** text box.
   A string enclosed with " " (double quotation marks) handled as one string and the rest following it is not output.
   Example: "AA"TEST → only "AA" is output.
- 2) In the case where assignment variable is assigned o data:

Directly enter a variable name (Scene variable: SC.~) or specify a variable in Variable

assignment window displayed by clicking

- Only one variable is valid for one data No.
   Example: SC.A\$+SC.B\$ → Only SC.A\$ is output.
- When a fixed string, e.g. AA, is entered before a variable, the subsequent variable is also handled as a fixed string.
  - Example: AA+SC.AA&  $\rightarrow$  "AA+SC.AA&"
- When "String" is selected in the "Data type" but "Integer" or "Double" is set to the variable, then the variable is converted to a string and then output.

	Y			
Variable name	Туре	Туре	Comment	1
Do not assign				
SC.AAA&	Scene	Integer		
SC.BBB#	Scene	Double		
SC.CCC\$	Scene	String		
SC.DDD&(0)	Scene	Integer array		
SC.EEE#(0)	Scene	Double array		
SC.FFF\$(0)	Scene	String array		
SY.MOJIRETSU\$	System	String		
SY.SYSTEM_A&	System	Integer		
SY.SYSTEM_B&	System	Integer		
SY.SYSTEM_C&	System	Integer		
SY.SYSTEM_D&	System	Integer		

**5** Enter *Title* that indicates the content of output data.

When String is selected in Data type, the following items in String setting area also needs to be set.

String setting
Size: 10 -
Character code: 0 -
When using language dependent characters, please specify the code page according to that language.

#### Example:

Outputsetting         Data Type         Data         Value         Title           No.         Offset         Data Type         Data         Value         Title           0         0         Double         SYSYSTEM_A&         173         1         8         String         SVMOURETSUS         FH/FJ-XXX           2         18         Double         111.409385069345         3         26         String         alueo           4         36         Integer         1234

7 Click **OK** in the end of entering data to close the settings.

### 2-1-14 EtherCAT Network Configuration Settings

To communicate with an NJ series Controller using EtherCAT, use the Sysmac Studio to register the Sensor Controller of the FH/FHV series to the network configuration.

# 内

#### **Precautions for Correct Use**

To connect the Sensor Controller of the FH/FHV series to an NJ/NX series Controller by Ether-CAT, first connect Sysmac Studio to with the Sensor Controller online and then perform the EtherCAT network configuration.

### Registering the Sensor Controller in the EtherCAT Slave Configuration

Using the Sysmac Studio, the Sensor Controller of the FH/FHV series is registered to the EtherCAT slave configuration on the Edit Network Configuration tab page.

For details of the registration procedures, refer to *Controller Configurations and Setup* in the *Sysmac Studio Version 1 Operation Manual (Cat. No. W504).* 

#### Precautions for Correct Use

Use Sysmac Studio Standard Edition version 1.09 or later to perform the settings for the Ether-CAT connections between the Sensor Controller of the FH series and an NJ-series Controller.

# Setting the Data Output Size

Use the Sysmac Studio to assign individual PDO communication area for each line in the master according to the Data Output Number settings in the EtherCAT communication specifications settings in the Sensor Controller of the FH/FHV series.

There are two setting methods.

### Online Settings

When the data output size has already set in the Sensor Controller of the FH/FHV series, follow the procedures below to perform the settings for the Sysmac Studio.

- **1** Connect the Sysmac Studio to the Sensor Controller of the FH/FHV series on-line.
- **2** Make the Sensor Controller off-line after on-line connection, the setting data will be loaded to the Sysmac Studio.
- **3** PDO communication areas will be assigned in the master according to the setting conditions of the EtherCAT communication specifications too.

### Offline Settings

When the data output size has not yet set in the Sensor Controller of the FH/FHV series and it will be set by the Sysmac Studio, follow the procedures below in offline state.

Display the window to edit the system data for the FH/FHV series.

- 2 Display the EtherCAT settings window and select the check boxes for the EtherCAT settings.
- **3** Restart the FH/FHV simulator to reflect the settings.
- **4** After the simulatorwas restarted, display the EtherCAT settings window again and set the Data Output Number for each line.
- 5

Restart the FH/FHV simulator to reflect the settings. PDO communication areas will be assigned in the master according to the setting conditions of

the EtherCAT communication specifications too.

#### Additional Information

If you change any parameter that requires that the Vision Sensor be restarted, **Burnary** will be displayed by the model in the Multiview Explorer. If this icon is displayed, restart the Vision Sensor.

#### Precautions for Correct Use

If six to eight lines are controlled in Multi-line Random-trigger mode, settings where the data output size (data output number)

is 256 bytes<sup>\*1</sup> cannot be used. If such 256-byte data output size is set, a warning mark will appear in Sysmac Studio.

\*1: Three types: Result Data Format 3 (DINT 64), Result Data Format 7 (LREAL 32), Result Data Format 11 (DINT16 + LREAL 24)

### 2-1-15 Communication Test

Here, check whether or not the EtherCAT communication settings are correct. In normal communication state, ECAT RUN-LED on the Sensor Controller lights green.

If the communications are not properly performed, check the communication specification settings. As error events are registered in the troubleshooting of the Sysmac Studio, check them to solve the problem. For details, refer to *2-1-25 Sysmac Error Status* on page 2-66.

#### Additional Information

For LED specifications of ECAT RUN LED for the Sensor Controller of the FH/FHV series, refer to 3-1 Sensor Controller in the Vision System FH series Hardware Setup Manual (Cat. No. Z366) or Smart Camera FHV series Setup Manual (Cat. No. Z408).

### 2-1-16 I/O Ports by Area (PDO Mapping) and Memory Allocation

This section describes each I/O port for the Command, Response, Data Output, User, and Sysmac Error Status Areas.

For the size, data type, initial value, and other information for each I/O port, refer to *Vision Sensor Specific Objects* in the *Manufacturer Specific Objects* on page 2-116.

# I/O Ports for the Command Area

I/O port name		Signal name	Function
Cont	trol Flag	Control signal	
	Command Request	Command Request	Switches from OFF to ON when the Controller (master) in- structs the Sensor Controller (slave) to process the control command. (Sets the control command code and parameters and then switches from OFF to ON.)
			Switches from ON to OFF by the Controller (master) when the Sensor Controller (slave) turns ON the Command Com- pletion signal.
	Trigger	Measurement Trig-	Switches from OFF to ON when the Controller (master) in- structs the Sensor Controller (slave) to process the measure- ment execution.
		ger	Switches from ON to OFF when the Trigger Acknowledged signal is turned ON.
	Flow Command Re- quest	Flow Command Request	Switches from OFF to ON when an entered command exe- cution is instructed during the execution of the Fieldbus flow control.
	quest		Switches from ON to OFF when the Flow Command Com- pletion signal is turned ON
	Error Clear	Clear Error	Switches from OFF to ON when the Error Status signal from the Sensor Controller (slave) is turned OFF.
	Error Clear		Switches from ON to OFF by the Controller (master) when the Error Status signal is turned OFF.
	Result Set Request	Data Output Re- quest <sup>*1</sup>	Switches from OFF to ON when the Controller (master) re- quests to output data. With this request, the Sensor Control- ler (slave) outputs the data.
	Result Set Request		Switches from ON to OFF by the Controller (master) when the Sensor Controller (slave) turns ON the Result Notification signal.
Com	mand Code	Command Code	Stores the command code
	imand imeter 0 to 3	Command parame- ters	Stores the command parameters

Controller (Master) to Sensor Controller (Slave)

\*1. Valid only when the output handshaking is set to ON.

### Precautions for Correct Use

٢Þ

Since Command Parameter 3 is the reserved area, it is unavailable. Use Command Parameter 0 to 2.

# I/O Ports for the Response Area

#### Sensor Controller (Slave) to Controller (Master)

I/O port name	Signal name	Function
is Flag	Status signal	
Command Comple- tion	Command Comple- tion	Switches from OFF to ON when the Sensor Controller (slave) completes the control command execution and stores the control command code, response code, and re- sponse data. Automatically switches from ON to OFF when the Controlle (master) turns OFF the Command Request signal.
BUSY	Busy	Turns ON when the Sensor Controller (slave) cannot perfor the control command. Turns OFF when the Sensor Controller (slave) can perform the control command.
Trigger Ready	Trigger Ready	Turns OFF when the Sensor Controller (slave) cannot per- form the measurement trigger. Turns OFF when the image window is set to "Through". In this case, the measurements can be processed. Turns ON when the Sensor Controller (slave) can perform the measurement trigger.
	Overall Judgment	Turns ON when the overall judgment is NG.
Total Judgment	Output	Turns OFF when the overall judgment is OK.
Run Mode	Run Mode	Turns ON when the Sensor Controller is in Run mode (In a measurement capable state with <i>RUN signal output</i> checks in the Layout settings for the currently displayed line). Turns OFF when the Sensor Controller (slave) is not in Run mode.
Trigger ACK	Trigger Acknowl- edged	Turns ON when the Sensor Controller receives the Trigger signal.
		Automatically turns OFF when the Trigger signal turns OFF
Command Ready	Command Ready	Turns ON when the control command can be performed.
Shutter Output	Shutter Trigger	Turns OFF when the control command cannot be performed Turns ON at the timing when the imaging elements complet exposure.
Shutter Output	Output	Turns OFF after one output cycle of the EtherCAT commun cations.
Flow Command Completion	Flow Command Completion	Turns ON after the echo back, response code, and response data for the executed command code are set during the ex- cution for the Fieldbus flow control.
Completion		Turns OFF after checking the Flow Command Request sig nal turned OFF.
Flow Command	Flow Command	Turns ON when an entered command is being executed during the execution of the Fieldbus flow control.
Busy	Busy	Turns OFF after checking the Flow Command Request sig nal turned OFF.
Flow Command Wait	Flow Command Wait	Turns ON when a command can be entered during the execution of the Fieldbus flow control.
	VVCIL	Turns OFF when an executed command is completed.

	I/O port name	Signal name	Function
	Error Status	Error Signal	Turns ON if the Sensor Controller (slave) detects an error.
		Error Signal	Turns OFF when the Sensor Controller (slave) runs normally.
			Switches from OFF to ON when the Sensor Controller (slave) completes the data out.
	Result Notification	Data Output Com- pletion	<ul> <li>Without handshaking Turns OFF after the "Output Time" set in the EtherCAT settings has passed.</li> <li>With handshaking Automatically switches from ON to OFF when the Control- ler (master) turns OFF the Result Set Request signal.</li> </ul>
Command Code Echo Back		Command Code Echo Back	Returns the executed command code.
Response Code		Response Code	Stores the response code for the executed command.
Response Data		Response Data	Stores the response data for the executed command.
Error Code		Error Code	Stores the event code for the Sysmac error status when an error occurs. For the event codes, refer to <i>Sysmac Error Status Event Code Table</i> on page 2-66.

# I/O ports for the Data Output Area

#### Sensor Controller (Slave) to Controller (Master)

I/O port name	Signal name	Data output number	Function
DINT Result Data 0 to 63	Output data 0 to 63	1 (4 bytes) to 64 (256 bytes)	Outputs data with the pattern se- lected in the Data Output Number
DINT Result Data 0 to 31	Output data 0 to 31	1 (8 bytes) to 32 (256 bytes)	settings in the communication set- tings. Ex.: When the <i>Data Output Number</i> is set to <i>32byte DINT 2 + LREAL3</i> , the I/O ports would be assigned as follows: DINT Result Data 0 DINT Result Data 1 LREAL Result Data 1 LREAL Result Data 1 LREAL Result Data 2

# I/O Ports for the User Input Area

I/O port name	Signal name	Data type	Function
User Input Area 0	User Input Area 0	DINT	When the User Area is set to "ON"
User Input Area 1	User Input Area 1	DINT	in the communication specification
User Input Area 2	User Input Area 2	DINT	settings, this area can be used as
User Input Area 3	User Input Area 3	DINT	an input area for the Sensor Con- troller that the user can write freely
User Input Area 4	User Input Area 4	LREAL	using the Macro Customization fea-
User Input Area 5	User Input Area 5	LREAL	ture.

#### Controller (Master) to Sensor Controller (Slave)

# I/O Ports for the User Output Area

#### Sensor Controller (Slave) to Controller (Master)

I/O port name	Signal name	Data type	Function
User Output Area 0	User Output Area 0	DINT	When the User Area is set to "ON"
User Output Area 1	User Output Area 1	DINT	in the communication specification
User Output Area 2	User Output Area 2	DINT	settings, this area can be used as
User Output Area 3	User Output Area 3	DINT	an output area for the Sensor Con-
User Output Area 4	User Output Area 4	LREAL	troller that the user can write freely using the Macro Customization fea-
User Output Area 5	User Output Area 5	LREAL	ture.

# I/O Ports for Sysmac Error Status Area

Sensor Controller (Slave) to Controller (Master)

The Sysmac Error Status is mapped only when the connecting destination is an NJ series Controller. Use Sysmac Studio (standard edition) Ver. 1.09 or later.

I/O port name Signal name		Function	
Sysmac Error Status Sysmac Error Status		Indicates the Sysmac error status.	
Observation	Observation Error	Turns ON when an observation error occurs in the Sensor Controller (slave).	
Minor Fault	Minor Fault Level Error	Turns ON when an minor fault level error occurs in the Sensor Controller (slave).	

2-1-16 I/O Ports by Area (PDO Mapping) and Memory Allocation

# Rules for I/O Port Name

An I/O port name consists of the device name and line number to be controlled as shown below. When only one line is controlled, the line number is defined as "Line 0".

Example: Command Request Signal in the Command Area

### E001\_Line0\_Command Request

### Device name

When the operation mode is Multi-line Random-trigger mode, the I/O ports for the Command Area, Response Area, and Data Output Area are allocated for each line. The I/O Ports for the Sysmac Error Status Area, however, are shared by all lines.

	I/O port		
Line used	Not Multi-line Random-trigger mode	Multi-line Random-trigger mode (Ex.: The number of lines is three.)	
Line 0	E001_Line0_Command_Request	E001_Line0_Command_Request	
Line 1	-	E001_Line0_Command_Request	
Line 2	-	E001_Line0_Command_Request	

# Allocating Device Variables to I/O Ports (PDO Mapping)

When the Sensor Controller is connected to a CPU unit for NJ series, the data for the PDO communications in the Sensor Controller is displayed as the I/O port names on the Sysmac Studio.

To the I/O ports, allocate device variables on the Sysmac Studio I/O map to perform programming and monitoring.

Multiview Explorer (Connected to a NJ series CPU Unit): **Configurations and Setup** - I/O Map (Double-click)

Select and right-click a slave or an I/O port on the I/O map, and select **Create Device Variable**. The device variable name is automatically created as a combination of the *device name* and *I/O port name*.

Or, select an I/O port and enter a variable name in the Variable column.

About the device name registration, there is another way like selecting a variable registered on the variable table instead of using the **Create Device Variable**, For details of the registering device variables, refer to the *Sysmac Studio Version 1 Operation Manual (Cat. No. W504)*.

# 2-1-17 I/O Signals

The following tables list the signals used to control I/O for EtherCAT.

# Input Signals

	Signal name	Function	ON/OFF timing	
Signal			OFF to ON	ON to OFF
Command Re- quest	Command Ex- ecution	This is turned on when the PLC will issue a command to the Sensor Controller.	This is turned on when the user (PLC) will is- sue a command (in- struct the execution) to the Sensor Controller based on the command code and command pa- rameters.	The user (PLC) switches from ON to OFF when the Com- mand Completion sig- nal from the Sensor Controller is turned ON.
Result Set Re- quest (Used only for handshaking output control)	Data Output Request Signal	The user (PLC) issues this signal to the Sensor Controller to request to output the results per- formed in the measure- ment flow. When this signal is ON while an output unit (Fieldbus data output unit) in the measure- ment flow is performed, the Sensor Controller outputs the data of the processing item. When multiple output units output data with 256 bytes and more, turn ON the Result Set Request signal again after the Result Notifi- cation signal for the first data output turns OFF. For details, refer to 2-1-23 Timing Chart on page 2-60.	<ul> <li>The signal turns ON when the user (PLC) requests to output the data of the meas- urement results. *2</li> <li>The Result Set Re- quest signal is turned ON at the same time when the Trigger (measurement trig- ger) signal or the Command Request signal switches from OFF to ON.</li> </ul>	The user (PLC) switches from ON to OFF when the Result Notification signal from the Sensor Controller is turned ON. <sup>*1</sup>
Error Clear	Error Clear	This is turned on when the ERR signal from the Sensor Controller will be cleared.	The user (PLC) switches the signal from OFF to ON when the Error Status signal from the Sensor Controller is turned OFF.	The user (PLC) switches the signal from ON to OFF when it de- tects that the Error Sta- tus signal is turned OFF.

2-1-17 I/O Signals

Signal	Signal name	Function	ON/OFF timing	
			OFF to ON	ON to OFF
Flow Com- mand Request	Flow Com- mand Request	This is turned on when a command will be per- formed while PLC Link, Fieldbus, or parallel flow control are per- formed.	The user (PLC) switches the signal from OFF to ON when it in- structs an entered com- mand execution during the execution of the Fieldbus flow control.	Switches from ON to OFF when the Flow Command Completion signal is turned ON
Trigger	Measurement Trigger	This is turned on when measurements will be performed.	The user (PLC) turns the signal ON to exe- cute measurements af- ter checking that the Trigger Ready signal is ON.	The user (PLC) switches the signal from ON to OFF when it de- tects that the Trigger Acknowledged signal is ON.

\*1. A timeout error will occur if the Result Set Request signal does not switch from ON to OFF within 10 seconds after the Result Notification signal turned ON.

In the case of EtherCAT, the data will not be discarded even though a timeout error occurred. Turn ON the Result Set Request signal after clearing the timeout error, the data when the timeout occurred is output.

\*2. A timeout error will occur if the Result Set Request signal does not switch from OFF to ON within the time set at the *Timeout* in the EtherCAT settings after the measurement processing starts by the Trigger (measurement trigger) signal or the Command Request signal turned ON.

# **Output Signals**

Signal Signal name	Function	ON/OFF timing		
	Signal name	Function	OFF to ON	ON to OFF
BUSY	Busy	This signal indicates that external inputs such as a command cannot be accepted. Be sure to issue com- mands under the condi- tion which this signal is OFF.*1*2*4	The Sensor Controller turns the signal ON when it receives a com- mand from the user (PLC). (After the Com- mand Request signal switches from OFF to ON.)	The signal turns OFF when the a command execution is completed.
Command Completion	Command Completion	The Sensor Controller uses this signal to in- form the PLC that com- mand execution has been completed.	The signal turns ON when the Sensor Con- troller completes execu- tion of a received com- mand.	The signal automatical- ly turns OFF when the user (PLC) switches the Command Request sig- nal from ON to OFF.

Signal	Signal name	Function	ON/OFF timing	
Signal	Signal name	Function	OFF to ON	ON to OFF
Result Notifica- tion	Data Output Completion	The signal informs the PLC of the timing to load output data. "ON" of this signal indi- cates that the Sensor Controller is outputting the data. The user (PLC) starts to load data when the sig- nal turns ON.	<ul> <li>Without handshaking The signal turns ON after the Sensor Con- troller performs the Output Unit (Fieldbus Data Output Unit) *1 in the measurement flow and is ready for the data output.</li> <li>With handshaking The signal turns ON after the Sensor Con- troller performs the Output Unit (Profibus Data Output Unit) *3 in the measurement flow and is ready for the data output and the Result Set Re- quest signal is ON.</li> </ul>	<ul> <li>Without handshaking The signal turns OFF after the <i>Output Time</i> set in the EtherCAT settings has passed.</li> <li>With handshaking The signal automati- cally turns OFF when the user (PLC) switches the Com- mand Request signal from ON to OFF.</li> </ul>
Error Status	Error Signal	The signal indicates that the Sensor Control- ler detects the following errors. For details, refer to <i>Error Messages and</i> <i>Troubleshooting</i> in the Vision System FH/FHV Series User's Manual (Cat. No. Z365)	The signal turns ON if the Sensor Controller detects an error.	The signal turns OFF when the error is fixed and the user (PLC) turns the Error Clear signal ON.
Run Mode	Run Signal	The signal indicates that the Sensor Control- ler in RUN mode.	The signal turns ON when the Sensor Con- troller is in Run mode (In a measurement ca- pable state with <b>RUN</b> <b>signal output</b> checked in the Layout settings for the currently dis- played line). ( <b>RUN LED</b> lights.)	The signal turns OFF when the Sensor Con- troller cannot perform measurements and without <b>RUN signal</b> <b>output</b> checked in the Layout settings for the currently displayed line).
Total Judgment	Overall judg- ment	The signal indicates the overall judgment re- sults.	The signal turns ON when the overall judg- ment is NG.	The signal turns OFF when the overall judg- ment is OK.
Trigger ACK	Trigger Ac- knowledged	The signal indicates that the Sensor Control- ler has accepted a Trig- ger signal.	The signal turns ON when the Sensor Con- troller receives the Trig- ger signal.	The signal turns OFF when the user (PLC) switches the Trigger signal from ON to OFF.
Command Ready	Command Ex- ecution Ready	The signal indicates that a control command is executable.	The signal turns ON when the control com- mand can be per- formed.	The signal turns OFF when the control com- mand cannot be per- formed.

Circual	Cianal news	Eurotion	ON/OFF timing	
Signal	Signal name	Function	OFF to ON	ON to OFF
Trigger Ready	Trigger Input Ready	The signal indicates that the Cameras as- signed to the Trigger signal can perform measurements. <sup>*5</sup>	The signal turns ON when the Cameras as- signed to it can perform measurements. (I.e. When a Trigger signal can be input.)	The signal turns OFF when even one of the Cameras assigned to the Trigger signals can- not perform measure- ment (i.e. When a Trig- ger signal cannot be in- put.)
Shutter Output	Shutter Trigger Output	<ul> <li>The signal indicates the timing at which the imaging elements complete exposure.</li> <li>When more than one Camera is connected, the signal turns ON to fit a Camera with the longest exposure time.</li> <li>The SHTOUT signal is unavailable when the image mode is set to "Through image".</li> <li>When more than one processing units related to the Camera Image Input is registered in the measurement flow, the SHTOUT signal turns ON for each processing unit. In that case, use the <i>Camera Switching</i> processing item instead of processing unit so the related to Camera Image Input processing units of the related to Camera Image Input processing unit instead of processing units of the related to Camera Image Input processing items in the middle of the measurement flow.</li> </ul>	The signal turns ON when the imaging ele- ments complete the ex- posure.	The signal follows the output signal settings. After the exposure is completed, the signal turns ON after the time set in the SHTOUT de- lay passed, and it turns OFF after the time set in the SHTOUT pulse width passed. For details of the SHTOUT signal output, refer to Setting the Out- put Signal Specifica- tions on page 2-357.
Flow Com- mand Comple- tion	Flow Com- mand Execu- tion Comple- tion	The signal indicates that a command per- formed while the Field- bus flow control is being performed has been completed.	The signal turns ON af- ter the echo back, re- sponse code, and re- sponse data for the executed command are set during the execution for the Fieldbus flow control.	The signal switches from ON to OFF when the Flow Command Re- quest signal switches form ON to OFF during the execution for the Fieldbus flow control.

Signal	Signal name	Function	ON/OFF timing		
Signal	Signal name	Function	OFF to ON	ON to OFF	
Flow Com- mand Busy	Flow Com- mand Execut- ing	The signal indicates that a command input during the execution for the Fieldbus flow con- trol is in execution.	The signal switches from OFF to ON when a command input during the execution for the Fieldbus flow control is in execution.	The signal switches from OFF to ON when a command execution in- put during the execution for the Fieldbus flow control is completed.	
Flow Com- mand Wait	Flow Com- mand Wait	The signal indicates that a command input can be accepted during the execution for the Fieldbus flow control.	The signal switches from OFF to ON when a command can be input during the execution for the Fieldbus flow con- trol.	The signal switches from ON to OFF when the Flow Command Re- quest signal switches form ON to OFF during the execution for the Fieldbus flow control.	

\*1. Although the BUSY signal remains ON during continuous measurement, the Sensor Controller accepts the Command Request signal only when the End Continuous Measurement command is performed.

- \*2. This will not be detected while commands received through any other protocol are processed. (Ex.: This signal remains OFF during measurements with the Trigger signal in the Parallel communications.) If you use more than one protocol and need to detect command execution, use the BUSY signal in Parallel.
- \*3. This occurs at which the Output Unit is performed after the measurement flow is performed in order from the top. not the moment at which measurement execution was completed.
- \*4. "ON" of this signal does not mean that a command is currently performed. To check whether a command is being executed, check the Command Completion (FLG) signal.
- \*5. When you use a camera with lighting controller, based on its type and connecting conditions, the time required for the READY or Trigger Ready signal to turn OFF may increase in comparison with not using it. For details, refer to *Camera Image Input FH*, *Camera Image Input HDR* or *Camera Image Input FHV* in the *Vision System FH/FHV Processing Item Function Reference Manual (Cat. No. Z341)*.

# 2-1-18 Measurement Results for which Output is Possible (Fieldbus Data Output)

The following data can be output using the processing items related to the Result Output. Measurement values are also referred using processing units such as expressions.

Measurement items	Character string	Description
Judgment	JG	Judgment result
DINT data 0 to 63	DI00 to DI63	Results of expressions that are set for output data 0 to 63 in DINT (4-byte) format. The numerical values in the following range are output as an integer type by 1000 times. -2147483.648 to 2147483.647
LREAL data 0 to 31	DL00 to DL31	Results of expressions that are set for output data 0 to 31 in LREAL (8-byte) format. The numerical values in the following range are output as double precision floating point format. -9999999999.9999 to 999999999.9999

# External Reference Tables (Fieldbus Data Output)

By specifying a number, the following data can be referred using control commands or processing items having a set/get processing unit data function.

Number	Data name	Set/Get	Data range
0	Judgment	Get only	0: No judgment (unmeasured) 1: Judgment result OK -1: Judgment result NG
1000 + 10*N (N = 0 to 63)	DINT data 0 to 63	Get only	-999999999999999999999999999999999999 <sup>*1</sup>
2000 + 10*N (N = 0 to 31)	LREAL data 0 to 31	Get only	-999999999999999 to 99999999999999 <sup>*1</sup>

\*1. Since the response data area is DINT type, so the data is acquired as numerical values in the following range as an integer type by 1000 times. -2147483.648 to 2147483.647

# 2-1-19 Command List

This section describes the commands used in EtherCAT.

#### Additional Information

Use device variables assigned to the I/O port of the command area to specify command codes and command parameters of commands used in EtherCAT.

To specify a command code or command parameter for a device variable, refer to the following: To specify a command code or command parameter for a device variable, refer to A-1-2 Details of Commands Used in EtherCAT Communications on page A-6

## • Execution Commands

Command code for Command Area (Hex)	Command name Function		Reference
0010 1010	Single Measurement	Performs measurement one time.	page A-15
0010 1020	Start Continuous Measurements	Performs continuous measure- ment.	page A-15
0010 1030	End Continuous Measurements	Ends continuous measurements.	page A-16
0010 1040	Execute Unit Test	Performs test measurement for the specified unit.	page A-16
0010 2010	Clear Measurement Values	Clears all measurement result values.	page A-17
0010 2020	Clear Data Output Buffer	Clears the data output buffer.	page A-18
0010 2030	Clear I/O Output Memory	Clear the I/O memory of the Field- bus data output destination.	page A-18
0010 2040	Clear Measurement State	Clears the measurement result value, data output buffer, and I/O memory of the Fieldus data output destination.	page A-19
0010 3010	Save Data in Sensor Controller	Saves the current system data and scene group data in the Sen- sor Controller.	page A-19
0010 4010	Re-register Model	Registers the model again.	page A-20
0010 5010	Scroll	Shifts the image display position by the specified amount.	page A-21
0010 5020	Zoom	Zooms the image display in or out by the specified factor.	page A-21
0010 5030	Fit	Returns the display position and display magnification to their de-fault values.	page A-22
0010 7010	Copy Scene Data	Copies the scene data.	page A-24
0010 7020	Delete Scene Data	Deletes the scene data.	page A-25
0010 7030	Move Scene Data	Moves the scene data.	page A-25
0010 8020	Load Registered Image	Loads the specified registered im- age as the measurement image.	page A-27
0010 9010	Echo	Returns an entered text string without changing it.	page A-27

2-1-19 Command List

Command code for Command Area (Hex)	Command name	Function	Reference
0010 B010	Return to Start of Flow	Branches to the start of the meas- urement flow (processing unit 0).	page A-30
0010 F010	Restart	Restarts the Sensor Controller.	page A-30

## • Commands to Get Status

Command code for Command Area (Hex)	Command name	Function	Reference	
0020 1000	Get Scene Number	Gets the current scene number.	page A-31	
0020 2000	Get Scene Group Number	Gets the current scene group number.	page A-31	
0020 4000	Get Layout Number	Gets the number of the layout that is currently displayed.	page A-32	
0020 5010	Get Display Image Unit Number	Gets the number of the Unit that is currently displayed in the specified page A-3 image display window.		
0020 5020	Get Display Sub-image Number	Gets the sub-image number that s currently displayed in the speci- ed image display window.		
0020 5030	Get Image Display Status	Gets the image mode for the specified image display window.		
0020 7010	Get Communications Input Status	Gets the input status (prohibited/ permitted) for the Communica- tions Modules.	page A-35	
0020 7020	Get Communications Output Sta- tus	Gets the output status (prohibited/ permitted) to an external device.	I Dade A-36	
0020 8010	Get Parallel Terminal Status	Gets the ON/OFF status for the specified parallel I/O terminal.		
0020 8020	Get All Parallel Terminal Status	Gets the ON/OFF status of all par- allel terminals except for DI termi- nals.	page A-40	
0020 8030	Get All Parallel DI Terminal Status	Gets the ON/OFF status of all par- allel DI terminals.	page A-42	
0020 A000	Get Operation Log State	Gets the current state of the oper- ation log.	page A-45	

## • Commands to Set Status

Command code for Command Area (Hex)	Command name	Function	Reference
0030 1000	Switch Scene	Switches to the specified scene number.	page A-46
0030 2000	Switch Scene Group	Switches to the scene group with the specified number.	page A-46

Command code for Command Area (Hex)	Command name	Function	Reference
0030 4000	Set Layout Number	Sets the layout number and switches the image.	page A-48
0030 5010	Set Display Image Unit Num- ber	Sets the number of the Unit to display in the specified image display window.	page A-49
0030 5020	Set Display Sub-image Num- ber	Sets the number of the sub- image to display in the speci- fied image display window.	page A-49
0030 5030	Set Image Display Status	Sets the image mode for the specified image display win- dow.	page A-50
0030 7010	Set Communications Input Status	Permits/prohibits inputs to the Communications Modules.	page A-51
0030 7020	Set Communications Output Status	Permits/prohibits outputs to external devices.	page A-52
0030 8010	Set Parallel Terminal Status	Sets the ON/OFF status of the specified parallel I/O terminal.	page A-52
0030 8020	Set All Parallel Terminal Status	Sets the ON/OFF status of all parallel terminals except for DO terminals.	page A-55
0030 8030	Set All Parallel DO Terminal Status	Sets the ON/OFF status of all parallel DO terminals.	page A-57
0030 A000	Set Operation Log State	Sets the state of the operation log.	page A-60

## • Commands to Read Data

Command code for Command Area (Hex)	Command name	Function	Reference
0040 1000	Get Unit Data	Gets the specified processing unit data.	page A-60
0040 4050	Get Data Logging Conditions	Gets the conditions set for data logging.	page A-67
0040 4060	Get Parallel Terminal Offset	Gets the parallel DI terminal offset data that is set.	page A-67

## • Commands to Write Data

Command code for Command Area (Hex)	Command name	Function	Reference
0050 1000	Set Unit Data	Sets the specified unit data.	page A-68
0050 4050	Set Data Logging Conditions	Sets the data logging conditions.	page A-73
0050 4060	Set Parallel Terminal Offset	Sets the parallel DI terminal offset data.	page A-75

## 2-1-20 Measurement Trigger Input

This section describes the ON/OFF timing for signals related to measurement trigger inputs using the following timing chart.

#### • Measurement Trigger Input Timing Chart

The Trigger signal is used to input a measurement trigger. Single measurement is performed each time the Trigger signal switches from OFF to ON.

- (1) The Controller (master) turns the Trigger signal ON after checking that the Trigger Ready signal is ON.
- (2) The Sensor Controller (slave) changes the status of the following signals.
  - Turns the BUSY signal ON.
  - Turns the Trigger Ack signal ON.
  - Turns the Trigger Ready signal OFF.
- (3) The Controller (master) turns the Trigger signal OFF.
- (4) The Sensor Controller (slave) turns the Trigger Ack signal OFF.
- (5) The Sensor Controller (slave) turns the Trigger Ready signal ON when an image input has completed and the measurement trigger input becomes available.
- (6) When measurement processing is completed, the Sensor Controller (slave) turns the Total Judgment signal ON.
- (7) When measurement processing is completed, the Sensor Controller (slave) turns the Total BUSY signal OFF.

# 2-1-21 Command Response Processing

About control command response processing, the following timing chart describes the ON/OFF timing of signals related to commands to be input.

### • Timing Chart for Command Execution

The Controller (master) uses the Command Request signal as a trigger to input and execute various commands such as measurement execution.

After a command was executed, turns the Command Request signal OFF when the Command Completion signal is turned ON.

\*1: A timeout error will occur if the Command Request signals does not turn OFF within 10 seconds. Then Command Completion signal and Busy signal will be forced to turn OFF.

\*2: Busy signal are automatically switched from ON to OFF when command execution is completed.

- (1) The Controller (master) sets the command code and command parameters.
- (2) After checking that the Command Ready signal is ON and the Command Completion signal is OFF, the Controller (master) turns the Command Request signal ON.
- (3) The Sensor Controller (slave) turns the Busy signal ON
- (4) The Sensor Controller (slave) sets the echoing back the command code, response code, and response data.
- (5) The controller (master) turns the Command Request signal OFF.

2-1 EtherCAT Connections

(6) The Sensor Controller (slave) turns the Command Completion signal OFF.

#### Continuous Measurement Command (Without handshaking)

Continuous execution is used to repeatedly execute measurement by starting the next measurement operation (image input and measurement processing) as soon as single measurement operation (image input and measurement processing) is completed.

Continuous measurement is started when the Start Continuous Measurements command is executed and ended when the End Continuous Measurements command is executed.

\*1: A timeout error will occur if you turn off the Command Request signal within 10 seconds after the Command Completion signal is turned ON.

Command Completion signal and Busy signal will be forcefully turned OFF.

\*2: Busy signal are automatically switched from ON to OFF when command execution is completed.

#### <Operation to Start Continuous Measurements>

- (1) The Controller (master) sets the command code and command parameters.
- (2) After checking that the Command Ready signal is ON and the Command Completion signal is OFF, the Controller (master) turns the Command Request signal ON.
- (3) The Sensor Controller (slave) sets the echoing back the command code, response code, and response data.
- (4) The Sensor Controller (slave) turns the Command Completion signal ON.

- (5) The controller (master) turns the Command Request signal OFF.
- (6) The Sensor Controller (slave) turns the Command Completion signal OFF.
- (7) The Sensor Controller (slave) starts continuous measurement.
- (8) The Sensor Controller (slave) turns the Busy signal ON and tune the Trigger Ready signal OFF.

### <Operation to End Continuous Measurement>

- (9) The Controller (master) sets the End Continuous Measurements command code during execution of continuous measurement by the Start Continuous Measurements command.
- (10) The Controller (master) turns ON the Command Request (EXE) signal.

## Additional Information

Continuous measurement is not ended in the middle of measurement. When the End Continuous Measurements command was executed, continuous measurement is ended after the measurement in execution was completed.

## <Ending Continuous Measurement>

- (11) The Sensor Controller (slave) stops continuous measurement and turns OFF the BUSY signal.
- (12) After setting the command code echo back and response code, the Sensor Controller (slave) turns ON the Command Completion (FLG) signal.
- (13) The Controller (master) turns OFF the Command Request (EXE) signal.
- (14) The Sensor Controller (slave) turns OFF the Command Completion (FLG) signal.

### Precautions for Correct Use

- The measurement during continuous measurement is given priority. Therefore, display of the measurement results (total judgment, images, judgment for each processing unit in the flow display, and detailed results) may sometimes not be updated.
- When continuous measurement is ended, the measurement results from the last measurement will be displayed.

## 2-1-22 Data Output

This section describes the ON/OFF timing for signals related to measurement data output after measurement completion using the following timing chart.

## Without handshaking

\*1, \*2: Data is output at the set output period\*1 and for the set output time.\*2 After data is output, the Result Notification signal is turned ON and the data is held for the data output time.

- (1) The Sensor Controller (slave) outputs data when the Fieldbus Data Output Unit starts execution.
- (2) Data is output each time that the Fieldbus Data Output Unit is performed for the second time or other Fieldbus Data Output Unit is performed. In that time, the output data for the first time is overwritten.

#### Precautions for Correct Use

Set the *Output period* in the communication settings to a time that is longer than the *Output time*.

#### With handshaking

The Result Notification signal switches from OFF to ON when the Controller (master) switches the Result Set Request signal from OFF to ON.

At that time, data that is possible to output will be output.\*1

The Controller (master) checks that the Result Notification signal is ON and acquires the data, and then it needs to switch the Result Set Request signal from ON to OFF.

In the case where multiple Fieldbus Data Output Units perform the data output, the Controller (master) needs to turn the Result Set Request signal ON again to instruct next data output when the Sensor Controller (slave) switched the Result Notification signal from ON to OFF.

\*1: Data prepared for output which an Output Unit has been already performed in the measurement flow.

\*: A timeout error will occur if any of the following states continues for longer than the timeout time that is set in the EtherCAT settings. • If the Result Set Request signal is not turned ON after a certain time elapses from when the Output Unit is executed.

(Turn ON the Result Set Request at the same time as the measurement trigger input or the command input.) • If the Result Set Request signal is not turned OFF after a certain time elapses from when the Result Notification signal turned ON.

- (1) The Controller (master) turns the Result Set Request signal ON.
- (2) When the Fieldbus Data Output Unit in the measurement flow is performed, the Sensor Controller (slave) writes the data and then turns the Result Notification signal ON.
- (3) The Controller (master) acquires the data and then turns the Result Set Request signal OFF.
- (4) The Sensor Controller (slave) turns the Result Notification signal OFF.
- (5) In the case where multiple Fieldbus Data Output Units are placed in the measurement flow, the Controller (master) turns the Result Set Request signal ON and then waits for the next Fieldbus Data Output Unit performed.
- (6) When the next Fieldbus Data Output Unit is performed, the Sensor Controller (slave) writes the data and then turns the Result Notification signal ON.

After that, repeat step 3 to 6.

## 2-1-23 Timing Chart

This section describes the ON/OFF timing for signals related to the sequence of operation from control command input until measurement data output after measurement completion using the following timing chart.

#### • Example 1: Inputting a Measurement Trigger after Switching a Scene without Handshaking

\*1: A timeout error will occur if you turn off the Command Request signal from Sensor Controller (master) within the timeout period set in the EtherCAT settings. Then Command Completion signal and Busy (BUSY) signal will be forced to turn off.
\*2: Busy (BUSY) signal is automatically switched ON from OFF when the command execution is completed.

\*3: Busy (BUSY) signal is automatically switched ON from OFF when the measurement is completed.

- (1) The Controller (master) sets the command code and command parameters for the scene switching command.
- (2) The Controller (master) checks that the Command Ready signal is ON and the Command Completion signal is OFF, and then turns the Command Request signal ON.
- (3) The Sensor Controller (slave) turns the BUSY signal ON and the Command Ready signal OFF, and then switches the scene.
- (4) The Sensor Controller (slave) turns the Trigger Ready signal ON after the switching scene is completed.
- (5) The Sensor Controller (slave) turns the Command Completion signal ON.
- (6) The Controller (master) turns the Result Set Request signal OFF.
- (7) The Sensor Controller (slave) turns the Command Completion signal OFF.

(8) The Controller (master) turns the Trigger signal ON.

### **Additional Information**

Before inputting a measurement trigger after changing the scene, first check that the Command Completion signal that was turned ON by execution of the scene change command has turned OFF, and that the Trigger Ready signal is ON.

- (9) The Sensor Controller (slave) turns the Trigger Ack signal ON and the Trigger Ready signal OFF.
- (10) The Controller (master) turns the Trigger signal OFF.
- (11) The Sensor Controller (slave) turns the Trigger Ack signal OFF.
- (12) the Sensor Controller (slave) turns the BUSY signal ON and performs measurement processing.
- The Sensor Controller (slave) turns the Trigger Ready signal ON when image input processing has (13) completed and the measurement trigger input becomes available.
- (14) When the Fieldbus Data Output Unit in the measurement flow is performed, the Sensor Controller (slave) writes the data and then turns the Result Notification signal ON.
- (15) After the time set at **Output time** in the EtherCAT settings passed, The Sensor Controller (slave) turns the Result Notification signal OFF.

#### Example 2: Outputting Data with more than one Output Unit Without Handshaking

\*1: Busy (BUSY) signal is automatically switched ON from OFF when the command execution is completed.

- (1) The Controller (master) checks that the Trigger Ready signal is ON and then turns the Trigger signal ON
- (2) The Sensor Controller (slave) turns the Trigger Ack signal ON and the Trigger Ready signal OFF.
- (3) The Controller (master) turns the Trigger signal OFF.
- (4) The Sensor Controller (slave) turns the Trigger Ack signal OFF.
- (5) the Sensor Controller (slave) turns the BUSY signal ON and performs measurement processing.
- (6) The Sensor Controller (slave) turns the Trigger Ready signal ON when image input processing has completed and the measurement trigger input becomes available.
- (7) When the first Fieldbus Data Output Unit in the measurement flow is performed, the Sensor Controller (slave) writes the data and then turns the Result Notification signal ON.
- (8) After the time set at **Output time** in the EtherCAT settings passed, The Sensor Controller (slave) turns the Result Notification signal OFF.
- (9) When the second Fieldbus Data Output Unit in the measurement flow is performed after the output cycle for the first one passed, the Sensor Controller (slave) turns the Result Notification signal ON.
- (10) After the time set at **Output time** in the EtherCAT settings passed, The Sensor Controller (slave) turns the Result Notification signal OFF.

### Additional Information

#### Saving All of the Measurement Results

If you output data from more than one Data Output Unit or for repeatedly measured output data (e.g., for continuous measurements), the same Data Output Area will be overwritten. To save all of the output data, adjust the *Output period* and *Output time* that are set in the

EtherCAT settings so that all of the output data is output and either receive all of the output data by using the Result Notification signal or use handshaking control.

Handshaking lets you control data output by using the Result Notification signal turning ON as a trigger for the data output timing and turning ON the Result Set Request to read the output data.

Each time that data is output (from the second output on), read the output data and move it to a different part of I/O memory in the PLC.

For more information on handshaking, refer to *Data Output Control with Handshaking* on page 1-25.

You can compare the received number of output data and the number of measurements for continuous measurements to check if all of the measurement results have been received. Use the following method to check the number of measurements that was actually executed.

Application Example

Set a calculation to count the number of measurements that are executed in the measurement flow.

If you set something like [DO+1], each time a measurement is executed (each time the measurement flow is executed), 1 will be added to DO, so the present value of DO will give you the actual number of measurements.

# 2-1-24 EtherCAT Troubleshooting

# Cannot Communicate with the Sensor Controller

Problem	Cause	Action
Data is not input and output at all.	The node address is set incorrectly.	Check the node address setting switches.
	The devices are not connected cor- rectly.	Check that the EtherCAT connec- tors (input and output) are connect- ed to the devices correctly.
	The <i>Output Option</i> is not selected in the Adjustment window.	Place a check to the <i>Output Option</i> in the Adjustment window.
	The communication module set- tings are set incorrectly.	Check that EtherCAT is set in the communication module settings.
EtherCAT communications are un- available due to <i>Slave Initialization</i> <i>Error (0x84230000)</i> .	PDO Mapping information (slot in- formation for MDP) is different be- tween the Sensor Controller and the Controller of the NJ/NX series.	<ul><li>Verify whether or not the following parameters are matched.</li><li>The number of controlled lines</li><li>Data output size</li><li>Use of User Area</li></ul>
EtherCAT communications are un- available due to <i>Slave Initialization</i> <i>Error (0x84280000)</i> .	The communication cycle for Ether- CAT (PDO communication cycle time) has been set lower than the predetermined value.	The minimum communication cycle time (PDO communication cycle time) depends on the number of lines to control, the number of bytes for output data, use of the User Area, and use of Multi-line Ran- dom-trigger mode. For details, refer to <i>Minimum PDO Communication</i> <i>Cycle Time</i> on page 2-18.

# A Timeout Error Occurred

Problem	Cause	Action
A handshaking timeout error occur- red.	<ul> <li>The Result Set Request signal is being turned ON and OFF too slowly.</li> <li>The following patterns are considered.</li> <li>The Result Set Request signal is not turned ON even measurement is completed.</li> <li>The Result Set Request signal is not switched from ON to OFF even the Result Notification signal is turned ON.</li> <li>The Result Set Request signal is not turned ON even the Result Notification signal is not turned ON even the Result Notification signal is turned OFF.</li> </ul>	After the measurement command is performed, turn the Result Set Re- quest signal ON and OFF within the timeout time set in the EtherCAT communication settings. Or, increase the timeout time.

# Settings are not kept

Problem	Cause	Action		
Settings such as Fieldbus Data	Changed the communication set-	Set the Fieldbus Data Output after		
Output Calculations or Comments	tings after setting the Fieldbus Data	performing the communication set-		
are not kept.	Output.	tings.		

### Additional Information

Errors that occur in the EtherCAT system, including sensor errors, are displayed as a Sysmac error status in Sysmac Studio(Standard Edition).

For Sysmac Error Status, refer to Sysmac Error Status Event Code Table on page 2-66.

# 2-1-25 Sysmac Error Status

The Sysmac Studio (standard edition) displays errors occurred in the EtherCAT system (including errors in the sensor) as Sysmac error status.

# Sysmac Error Status Event Code Table

This section describes the event codes for the Sysmac error status related to the Sensor. For details of the event code, refer to *NJ-series Troubleshooting Manual (Cat. No. W503)*.

\*1. Level of Severity

• Major Fault Level:

These errors make the Controller be totally out of control. If a major error is detected, the execution of user programs is immediately stopped and loads for all slaves including remote I/Os are cut off.

2-1-25 Sysmac Error Status

You cannot clear major fault level errors through user programs, Sysmac Studio, or a PT of the NS series. To recover this situation, remove the cause of the error, and either turn the power supply for the Controller off and on or reset it using System Studio.

Partial Fault Level:

These errors make a certain function module in the Controller be totally out of control. The Controller of the NJ series continues to perform user programs even after a partial error occurs. To recover from the situation, remove the cause of the error, and perform either one of the following.

- Reset the error through user programs, Sysmac Studio, or an PT of the NS series.
- Turn the power supply for the Controller off and on
- Reset the Controller through Sysmac Studio.
- Minor Fault Level:

These errors make a part of a certain function module in the Controller be out of control. The troubleshooting for these errors is the same as the processing for the partial fault level errors.

Observations:

These errors do not affect the Controller control.

Although these errors do not affect the control, the purpose of them is to warn users so that the errors do not develop into higher level errors.

 Information: Notifications other than above errors.

# **Checking Sysmac Error Status**

The Sysmac error status can be checked by the troubleshooting functions of the Sysmac Studio (standard edition). For details of the troubleshooting function, refer to *NJ/NX series Troubleshooting Manual (Cat. No. W503)*.

**1** Select **Troubleshooting** from the **Tool** menu while online or click **Troubleshooting** in the toolbar.

The Troubleshooting dialog box is displayed.

2 Click the Controller Errors tab.

A list of the current Sysmac error status and corresponding event codes will be displayed.

# **Clearing Sysmac Error Status**

**1** Remove the cause of the error, then click **Reset All** on the **Controller Errors** tab page in the **Troubleshooting** dialog box.

#### Additional Information

Even if you reset the Sysmac error status, the error log will remain in the logs on the **Controller Event Log** tab.

# **Error Details**

This section describes details on errors. The items used to describe individual errors (events) are described in the following copy of an error table.

Event name	Name of the e	rror		Event code	Code of the er	rror				
Description	Short descript	tion of the error								
Source	Source of the error		Source de- tails	Details on the source of the error	Detection timing	When the error is detected.				
Error attrib- utes	Level	The level of influence on control <sup>*1</sup>	Recovery	Recovery method <sup>*2</sup>	Log catego- ry	Which log the error is saved in. <sup>*3</sup>				
Effects	User pro- gram	What will happen to execution of the user program. <sup>*4</sup>	Operation	Special information on the operation at the error occurrence.						
LED	indicator statu		only for errors i		series Controlle Master Functio

Cause and correction	Occurrence fa sumed cause)	•	Correction		Prevention					
	Lists the poss	ible causes, co	rrections, and p	preventive mea	sures for the er	ror (event).				
Additional information	Additional info	ormation displa	yed by the Sys	mac Studio or a	an PT of the NS	series.				
Precautions/ Remarks	Precautions, r	Precautions, restrictions, and supplemental information								

- \*1. One of the following: Major fault: Major fault level Partial fault: Partial fault level Minor fault: Minor fault level Observation Information
- \*2. One of the following:

Automatic recovery: Normal status is restored automatically when the cause of the error is removed. Error reset: Normal status is restored when the error is reset after the cause of the error is removed. Cycle the power supply: Normal status is restored when the power supply to the Controller is turned OFF and then back ON after the cause of the error is removed.

Controller reset: Normal status is restored when the Controller is reset after the cause of the error is removed.

Depends on cause: The recovery method depends on the cause of the error.

\*3. One of the following: System: System event log Access: Access event log

\*4. One of the following:

Continues: Execution of the user program will continue. Stops: Execution of the user program stops. Starts: Execution of the user program starts.

# 2-1-26 Sysmac Device Features

Sysmac Devices are the control device products designed based on standardized communications and user interface specifications for OMRON control devices.

And the features available with them are so called "Sysmac Device Features".

This section describes the features when they are combined with a Machine Automation Controller such as NJ series, and with automation software.

# Sysmac Error Status

Since errors occurring in slaves are systematized in Sysmac Devices, you can check the causes and measures for errors with common procedures using Sysmac Studio.

The status of an error can be monitored at the Sysmac Error Status (2002 Hex - 01 Hex). To display the error status detected by the Sensor Controller for the FH/FHV/FZ5 series to Sysmac Studio, map the Sysmac Error Status (2002 Hex - 01 Hex) to the PDO. Sysmac Studio, by default, uses 1BFF Hex: 512th transmit PDO mapping assignment to map Sysmac Error Status (2002 Hex - 01 Hex) automatically to the PDO.

#### **Additional Information**

- For the Sysmac Error status (2002-01 hex), refer to 2-1-27 Object Dictionary on page 2-87.
- For errors displayed in Sysmac Studio, refer to *NJ/NX series Troubleshooting Manual (Cat. No. W503)*.

2

2-1-26 Sysmac Device Features

# Saving Node Address Settings

When the node address switch is set to *00*, it means Software Setup mode, the node address setting value set in Sysmac Studio is enabled. When it is other than *00*, The value of the node address switch is used as the node address.

In the Software Setup Mode, perform *Write Slave Node Address* on the *EtherCAT Edit* in Sysmac Studio, save the slave node address setting in the nonvolatile memory in the Sensor Controller.

### Software Settings

The setting value saved as Slave Information Interface (SII) in the nonvolatile memory in the slave is the node address.

### Node Address Switch Setting

The value set to the node address switch is the node address.

## Serial Number Display

The serial number saved in the non-volatile memory in the Sensor Controller is displayed at 1018 Hex - 04 Hex: Serial Number.

Controllers supporting Sysmac Device Features use this serial number to grasp the network configuration.

When grasping it, set **Serial No. Check Condition** to **Set Value = Actual Unit** on **EtherCAT Edit** screen in Sysmac Studio.

If the specified condition is not satisfied, "Network Configuration Check Error" will occur.

#### **Additional Information**

The network configuration check detects any slave devices that have been replaced, which prevents you from forgetting to set parameters on those slaves.

## Compliance with ESI Specification (ETG. 2000 S (R) V1.0.1)

The ESI specifications are a set of specifications defining the entries required in an EtherCAT Slave Information (ESI) file.

# SII Data Check

The Slave Information Interface (SII) is an interface area in the non-volatile memory of an EtherCAT slave in which the configuration information for the EtherCAT slave is stored.

EtherCAT slaves as Sysmac Device check the SII information.

If SII information, which slaves cannot accepted, was written here, an SII Check Error (Error No. 88.3) occurs.

If the problem still exists even after it is restarted, contact your OMRON sales representative.

#### Precautions for Correct Use

Do not use third-party or any other configuration tools to edit the SII information.

2

### 2-1-27 Object Dictionary

The CAN application protocol over EtherCAT (CoE) protocol is based on the object dictionary of the CAN application protocol. This section describes the object dictionary and each object.

# **Object Dictionary Area**

Each object is allocated with an index of four-digit hexadecimal value, and the indexes are configured in the area below.

Indexes	Areas	Description
0000 Hex to 0FFF Hex	Data Type area	Definitions of data types
1000 Hex to 1FFF Hex	CoE Communication area	Definitions for variables that can be applied to all servers for a dedicated communication.
2000 Hex to 2FFF Hex	Manufacture Specific area 1	Variables defined for all OMRON products.
3000 Hex to 5FFF Hex	Manufacture Specific area 2	Variables defined for EtherCAT Slave Units of the FH/FHV series. Command/response method using message communication (SDO)
6000 Hex to 6FFF Hex	Input area	Objects mapped to TxPDO
7000 Hex to 7FFF Hex	Output area	Objects mapped to RxPDO
8000 Hex to 8FFF Hex	Configuration area	Objects for configurations and settings
8000 Hex to 8FFF Hex	Information area	Not used (Unsupported)
A000 Hex to AFFF Hex	Diagnosis area	Not used (Unsupported)
B000 Hex to BFFF Hex	Send Service area	Not used (Unsupported)
C000 Hex to EFFF Hex	Reserved area	Area reserved for future use
F000 Hex to FFFF Hex	Device Profile area	Parameters belonging to devices

### • Data types

This profile uses the data types below.

Data types	Code	Size	Range
Boolean	BOOL	1 bit	true(1), false(0)
Unsigned8	U8	1 bytes	0 to 255
Unsigned16	U16	2 bytes	0 to 65535
Unsigned32	U32	4 bytes	0 to 4294967295
Integer8	INT8	1 byte	-128 to 127
Integer16	INT16	2 bytes	-32768 to 32767
Integer32	INT32	4 bytes	-2147483648 to 2147483647
Visible string	VS	-	-
Double	Double	8 bytes	-1.79769313486231e+308 to 1.79769313486231e + 308

# **Object Description Format**

Here, describes objects by the following format.

#### Object Description Format

<index></index>	<object name=""></object>					
Range: <settin< td=""><td>g range&gt;</td><td>Unit: <unit></unit></td><td></td><td>Default: <defau< td=""><td>ult setting&gt;</td><td>Attribute: <data attrib-<br="">ute&gt;</data></td></defau<></td></settin<>	g range>	Unit: <unit></unit>		Default: <defau< td=""><td>ult setting&gt;</td><td>Attribute: <data attrib-<br="">ute&gt;</data></td></defau<>	ult setting>	Attribute: <data attrib-<br="">ute&gt;</data>
Size: <size></size>		Access: <acces< td=""><td>ss&gt;</td><td>PDO map: <po sible&gt;</po </td><td>ssible/Not pos-</td></acces<>	ss>	PDO map: <po sible&gt;</po 	ssible/Not pos-	

#### Object Description Format with Sub-indexes

<index></index>	<object name=""></object>							
Sub-index 0								
Range: <setting range=""></setting>		Unit: <unit></unit>		Default: <default setting=""></default>		Attribute: <data attrib-<br="">ute&gt;</data>		
Size: <size></size>			Access: <access></access>		PDO map: <possible not="" pos-<br="">sible&gt;</possible>			
			:					
Sub-index N								
Range: <settin< td=""><td>g range&gt;</td><td>Unit: <unit></unit></td><td></td><td>Default: <defau< td=""><td>ult setting&gt;</td><td>Attribute:</td></defau<></td></settin<>	g range>	Unit: <unit></unit>		Default: <defau< td=""><td>ult setting&gt;</td><td>Attribute:</td></defau<>	ult setting>	Attribute:		

Range: <setting range=""></setting>	Unit: <unit></unit>		Default: <default setting=""></default>		Attribute:
					<data attrib-<="" td=""></data>
					ute>

The following values are indicated within the pointed brackets <>.

Indexes	:	An object index given by a four-digit hexadecimal number.
Object name	:	Object name
Range	:	Range for settable numerical value
Unit	:	Physical unit
Default	:	Default value set at product shipment
Attribute	:	Timing at which changes are enabled in a writable object.
		A: Always enabled
		B: Timing of transition from count stop to operation (Encoder Input Slave Unit only)
		C: Timing of transition from pre-operational state to safe-operational state
		D: Timing of transition from pre-operational state to initial value state
		R: Updated after the power supply is reset.
		- : Read only
Size	:	The object size in bytes
Access	:	Indicates whether the object is read-only or readable and writable.
		RO: Read-only
		RW: Readable and writable
PDO map	:	Indicates the PDO mapping availability.

# **Communication Objects**

1000 Hex	Device Type					
Range: -		Unit: -		Default: 00000	000 Hex	Attribute: -
Size: 4 bytes (U32)		Access: RO		PDO map: Not	possible	

• The Sensor Controllers of the FH/FHV series do not support a device profile.

1001 Hex	Error Register					
Range: -		Unit: -		Default: 00 Hex	<	Attribute: -
Size: 1 byte (U8)		Access: RO		PDO map: Not	possible	

• The table below indicates the error types occurring in a Slave Unit.

Bit	Name	Bit	Name
0	General error	4	Communication error
1	Current error	5	Device profile specific error
2	Voltage error	6	(Reserved)
3	Temperature error	7	Manufacture specific error

1008 Hex	Manufacturer Device Name						
Range: -		Unit: -		Default: by Slav	ve Unit type <sup>*1</sup>	Attribute: -	
Size: 20 bytes (VS)			Access: RO		PDO map: Not	possible	

• Indicates the Slave Unit model number.

1009 Hex	Manufacturer Hardware Version						
Range: -		Unit: -		Default: by Slav	ve Unit type <sup>*1</sup>	Attribute: -	
Size: 20 bytes (VS)			Access: RO		PDO map: Not	possible	

• Indicates the version of the Slave Unit hardware.

100A Hex	Manufacturer Software Version						
Range: - Unit: -				Default: by Slav	ve Unit type <sup>*1</sup>	Attribute: -	
Size: 20 bytes (VS)			Access: RO	*	PDO map: Not	possible	

• Indicates the version of the Slave Unit software.

\*1: The default settings for the manufacture device name, manufacture hardware version, and manufacture software version are shown below for each slave.

2

2-1 EtherCAT Connections

Range: -		Unit: -		Default: Each l	Jnit	Attribute: -
Size: 4 bytes (l	J32)		Access: RO		PDO map: Not	possible

- · Indicates the device information.
- Sub-index 1 (Vendor ID) indicates the manufacturer identifier.
- Sub-index 2 (Product Code) indicates the value assigned to each Slave Unit type.
- Sub-index 3 (Revision Number) indicates the Unit revision number.
- Bit 0 to 15: Minor revision number of the device
- Bit 16 to 31: Major revision number of the device
- Sub-index 4 (Serial Number) indicates a serial number for each product.

\*1: The values of sub-index 2 (Product Code) and sub-index 3 (Revision Number) for the Identity Object are below for each slave.

Slave	Product Code (Hex)	Revision Number (Hex) <sup>*1</sup>
FH-1050	0000 00A0	0001 0002
FH-1050-10	0000 00A1	0001 0002

10F3 Hex	Diagnosis History					
Sub-index 0: Number of entries						
Range: -		Unit: -		Default: 0D He	x	Attribute: -
Size: 1 byte (U8	3)		Access: RO		PDO map: Not	possible
Sub-index 1: Maximum Messages						
Range: -		Unit: -		Default: 00 Hex	(	Attribute: -
Size: 1 byte (U8	3)		Access: RO		PDO map: Not	possible
Sub-index 2: Newest Message						
Range: -		Unit: -		Default: -		Attribute: -
Size: 1 byte (U8	3)		Access: RO		PDO map: Not possible	
Sub-index 5: Fla	ags					
Range: 0000 H	ex to 0001 Hex	Unit: -		Default: 0000 F	lex to 0001	Attribute: -
				Hex		
Size: 2 bytes (U16)			Access: RW		PDO map: Not	possible
Sub-index 6 to	Sub-index 6 to 13: Diagnosis Message 1 to 8					
Range: -		Unit: -		Default: -		Attribute: -
Size: 23 bytes (	Size: 23 bytes (VS)   Access: RO   PDO map: Not possible					possible

2

- This objects indicates up to eight diagnosis histories. It also sets whether or not to notify emergency messages.
- Sub-index 1 (Maximum Messages) indicates the number of error messages.
- Sub-index 2 (Newest Message) indicates the sub-index number for the latest diagnosis history.
- Sub-index 5 (Flags) is the control flag for the diagnosis history. It sets whether or not to notify error messages via emergency messages. Setting 0001 Hex means to notify. It is set to 0000 Hex (no emergency notification) at startup.
- Eight errors are stored into the sub-index 6 to 13 sequentially. The 9th error and onward are stored into the sub-index 6 to 13 (Diagnosis message 1 to 8) again.
- The Sensor Controllers of the FH/FHV series support the flag only.

# PDO Mapping Object

The indexes from 1600 Hex to 17FF Hex are used for RxPDO mapping, and from 1A00 Hex to ABFF Hex are for Tx PDO mapping. The sub-index 1 and onward indicate information for the application object to be mapped.

31	16	15	8 7	0	
	Indexes	Sub-indexes	Bit	length	
MSB				LSB	
Bit 0 to 7	Bit 0 to 7 : Bit length of the mapped object (Ex.: for 32 bits, 20 Hex is displays.)				
Bit 8 to 15	: Sub-index of the mapped	object			
Bit 16 to 31	: Index of the mapped obje	ect			

1600 Hex	1st receive PDO Mapping				
Sub-index 0: Number of objects					
Range: -	Range: - Unit: - De			Default: 32 Hex	(
Size: 1 byte (U8	8)		Access: RO		PDO map: Not possible
Sub-index1-32:	1st to 32nd Out	put Object to be	mapped		
Range: -		Unit: -		Default: 70000101/7000 01101Hex	00201/70000901/70001001/700
Size: 4 bytes (U32)		Access: RO		PDO map: Not possible	

• The object gives the mapping for an application using Vision Sensor functions.

• The 7000 Hex (control flag) is mapped in units of bit.

1601 Hex	2nd receive PDO Mapping				
Sub-index 0: Number of objects					
Range: -		Unit: -		Default: 05 Hex	(
Size: 1 byte (U8	3)	Access: RO			PDO map: Not possible
Sub-index 1: 1st Output Object to be mapped					
Range: -		Unit: -		Default: 70010	020 Hex
Size: 4 bytes (L	J32)		Access: RO		PDO map: Not possible
Sub-index 2: 2nd Output Object to be mapped					
Range: -		Unit: -		Default: 70020120 Hex	
Size: 4 bytes (U32)		Access: RO		PDO map: Not possible	

Sub-index 3: 3rd Output Object to be mapped					
Range: -	Unit: -		Default: 70020220 Hex		
Size: 4 bytes (U32)	Access: RO			PDO map: Not possible	
Sub-index 4: 4th Output Object to be mapped					
Range: -	Unit: -		Default: 70020320 Hex		
Size: 4 bytes (U32)		Access: RO		PDO map: Not possible	
Sub-index 5: 5th Output Object to be mapped					
Range: -	Unit: -		Default: 70020420 Hex

1BFFh	512th transmit PDO Mapping					
Sub-index 0: Number of objects						
Range: - Unit: - Default: 01 Hex Attribute: -				Attribute: -		
Size: 1 byte (U8) Access: RO PDO map: Not possible					possible	
Sub-index 1: 1st Input Object to be mapped						
Range: -	ge: - Unit: -		Default: 20020108 Hex		Attribute: -	
Size: 4 byte (U32) Access			Access: RO		PDO map: Not	possible

- This object gies the mapping for notification of errors that are detected in the Slave Unit.
- The mapping includes 2002 Hex 01 Hex: Sysmac Error Status.
- When a Machine Automation Controller of the NJ series are connected, 1C13 Hex: Sync manager 3
  PDO assignment is assigned to this object. This object is automatically assigned in the default settings of Sysmac Studio.

### Sync Manager Communication Objects

The communication memory for EtherCAT is set by the objects from 1C00 Hex to 1C13 Hex.

1C00 Hex	Sync Manager Communication Type							
Sub-index 0: Number of used Sync Manager channels								
Range: -		Unit: -		Default: 04 Hex	<	Attribute: -		
Size: 1 byte (U	8)		Access: RO		PDO map: Not	possible		
Sub-index 1: C	ommunication Ty	/pe Sync Manag	er 0	_				
Range: -		Unit: -		Default: 01 Hex	<	Attribute: -		
Size: 4 bytes (l	J8)		Access: RO		PDO map: Not	possible		
Sub-index 2: Communication Type Sync Manager 1								
Range: -		Unit: -		Default: 02 Hex		Attribute: -		
Size: 4 bytes (l	J8)		Access: RO	PDO map: No		possible		
Sub-index 3: C	ommunication Ty	/pe Sync Manag	er 2					
Range: -		Unit: -		Default: 03 Hex	<	Attribute: -		
Size: 4 bytes (l	J8)		Access: RO		PDO map: Not possible			
Sub-index 4: Communication Type Sync Manager 3								
Range: -		Unit: - Default: 0		Default: 04 Hex	<	Attribute: -		
Size: 4 bytes (l	J8)		Access: RO		PDO map: Not	possible		

The sync manager has the following settings.

- SM0: Mailbox reception (EtherCAT Master Unit to Slave Unit)
- SM1: Mailbox transmit (EtherCAT Slave Unit to Master Unit)
- SM2: Process data output (EtherCAT Master Unit to Slave Unit)
- · SM3: Process data input (EtherCAT Slave Unit to Master Unit)

1C10 Hex	Sync manager 0 PDO Assignment					
Sub-index 0: Number of assigned PDOs						
Range: 00 Hex		Unit: -	Unit: -		(	Attribute: -
Size: 1 byte (U8)			Access: RO	•	PDO map: Not	possible

• This indicates the number of PDO mappings used by this sync manager.

• Mailbox reception sync manager does not have PDOs.

1C11 Hex	Sync manager 1 PDO Assignment					
Sub-index 0: Number of assigned PDOs						
Range: 00 Hex		Unit: -		Default: 00 Hex	(	Attribute: -
Size: 1 byte (U8)			Access: RO		PDO map: Not	possible

• This indicates the number of PDO mappings used by this sync manager.

· Mailbox transmit sync manager does not have PDOs.

Sync manager 2 PDO Assignment							
Sub-index 0: Number of assigned PDOs							
	Unit: -		Default: 02 Hex		Attribute: -		
3)	Access: RW <sup>*1</sup>		PDO map: Not		possible		
2: 1st to 2nd PD	O Mapping Obje	ct Index of assig	ned PDO				
	Unit: -		Default: by Slave Unit type		Attribute: -		
Size: 2 bytes (U16)		Access: RW <sup>*1</sup>		PDO map: Not possible			
	amber of assigner 3) 2: 1st to 2nd PD	Unit: - 2: 1st to 2nd PDO Mapping Obje	imber of assigned PDOs Unit: - 3) Access: RW <sup>*1</sup> 2: 1st to 2nd PDO Mapping Object Index of assig Unit: -	imber of assigned PDOs Unit: - Default: 02 Hex Access: RW <sup>*1</sup> 2: 1st to 2nd PDO Mapping Object Index of assigned PDO Unit: - Default: by Slave	imber of assigned PDOs Unit: - Default: 02 Hex Access: RW <sup>*1</sup> PDO map: Not 2: 1st to 2nd PDO Mapping Object Index of assigned PDO Unit: - Default: by Slave Unit type		

\*1. If a receive PDO is not provided, *RO* is used.

• This indicates the RxPDOs used by this sync manager.

1C13 Hex	Sync manager 3 PDO Assignment							
Sub-index 0: Number of assigned PDOs								
Range: -		Unit: -		Default: 05 Hex		Attribute: -		
Size: 1 byte (U	8)		Access: RW <sup>*1</sup>	PDO map: Not po		possible		
Sub-index 1 to	5: 1st to 5th PDC	O Mapping Object	ct Index of assig	ned PDO				
Range: -		Unit: -		Default: by Slave Unit type		Attribute: -		
Size: 2 bytes (U16)		Access: RW <sup>*1</sup>		PDO map: Not	possible			

\*1. If a transmit PDO is not provided, *RO* is used.

• This indicates the TxPDOs used by this sync manager.

## Manufacturer Specific Objects

This section describes the CiA401 generic I/O module device profile and the specific objects, implemented in EtherCAT Slave Units for the Sensor Controller.

#### Common Objects for Sysmac Devices

Manufacture Specific area 1

2100 Hex	Error History Cl	ear				
Range: -		Unit: -		Default: 00000	000 Hex	Attribute: A
Size: 4 bytes (l	J32)		Access: RW		PDO map: Not	possible

• This object clears the diagnosis history at 10F3 Hex (Diagnosis History).

It clears history only when a specific value are written. The specific value is elcl.

MSB			LSB
I	С	1	е
6C Hex	63 Hex	6C Hex	65 Hex

Writing values other than these is invalid.

2002 Hex Sysr	nac Error							
Sub-index 0: Number of entries								
Range: -	Unit: -		Default: 02 Hex	<	Attribute: -			
Size: 1 byte (U8)		Access: RO		PDO map: Not possi				
Sub-index 1: Sysmac Error Status								
Range: -	Unit: -		Default: 00 Hex		Attribute: -			
Size: 1 byte (U8)	•	Access: RW		PDO map: Not possible				
Sub-index 2: Sysmac Error Status Clear								
Range: -	Unit: -	Unit: -		<	Attribute: A			
Size: 1 byte (U8)	1 byte (U8) Access: R			PDO map: Not	possible			

- This mapping is used to notify and clear Sysmac Error Status.
- Sub-index 1: Sysmac Error Status
  - This object is used to notify errors detected in the Slave Unit.
  - When a Machine Automation Controller of the NJ series are connected, map this object to a PDO.
- Sub-index 2: Sysmac Error Status Clear
  - This object is used by the Controller (a Sysmac Device) to reset errors occurring in Slave Units.

### **Additional Information**

In the default Sysmac Studio settings, sub-index 1 (Sysmac Error Status) is automatically mapped to a PDO because 1BFF hex (512th transmit PDO Mapping) is assigned

2200 Hex	Communication Error Setting					
Range: 00 Hex	to 0F Hex	0F Hex Unit: number of sequences De			K	Attribute: C
Size: 1 byte (U8)		Access: RW		PDO map: Not	possible	

- · Object implemented only on Slave Units operating in the DC mode.
- The number of consecutive times for detecting communications errors is set with this object.
- The setting range is from 00 to 0F Hex and the number of detections is the set number of times + 1.
- Although the value is rewritable in the DC mode operation, the operation is performed with the value set when the operation is shifting from the pre-operational state to safe-operational state. Note that at this point, the rewritten value is read.

#### **Additional Information**

With the default setting of 01 hex, an error is detected if communications errors occur twice in a row.

2201 Hex	Sync Not Received Timeout Setting					
Range: 0000 H	ex to 0258 Hex	x Unit: s Default: 0000 Hex Attribute:				
Size: 2 bytes (U16)		Access: RW		PDO map: Not	possible	

2-1-27 Object Dictionary

- Object implemented only on Slave Units operating in the DC mode.
- This object is used to set the standby time until the first synchronization interrupt signal (SYNC0) is input after shifting to the safe-operational state where a DC mode is confirmed.
- If the first interrupt signal (SYNC0) is not input at all within this set time, a synchronization error occurs.
- The setting range is from 0000 Hex to 0258 Hex (600 [s]) and operation is performed at 120 [s] when 0000 Hex is set.
- Although the value is rewritable in the DC mode operation, the operation is performed with the value set when the operation is shifting from the pre-operational state to safe-operational state. Note that at this point, the rewritten value is read.

Size: 1 bit (BOOL)		Access: RO		PDO map: Possible
Sub-index 18 to 32: Control Reserve Bit 18 to 32				
Range: True (1) or False (0)	Unit: -		Default: False (0)	
Size: 1 bit (BOOL)		Access: RO		PDO map: Possible

- This object is used to get the status of the Sensor Controller.
- Command Completion bit: ON during command execution.
- BUSY bit: ON during command or measurement execution.
- · Trigger Ready bit: ON when Trigger signal can be input.
- Overall Judgment bit: ON when the overall judgment is NG.
- Run Mode bit: The signal turns ON when the Sensor Controller is in Run mode (In a measurement capable state with *RUN signal output* checked in the Layout settings for the currently displayed line).
- Trigger Ack bit: The signal turns ON when the Sensor Controller receives the Trigger signal.
- Command Ready bit: ON when a control command can be executed.
- Shutter Output bit: ON when the imaging elements have completed exposure.
- Flow Command Completion bit: ON when execution of a command that was executed during execution of PLC Link, Fieldbus, or normal flow control has been completed.
- Flow Command Busy bit: ON during execution of a command that was input during execution of PLC Link, Fieldbus, or normal flow control.
- Flow Command Wait bit: ON while waiting for command input during execution of PLC Link, Fieldbus, normal flow control.
- Error Status bit: ON when the Sensor Controller has detected an error.
- · Result Notification bit: ON when the Sensor Controller completes data output.
- When you use the Sysmac Studio, the sub-index 1 including the above all bits is mapped.

6001 Hex	Command Code Echo Back				
Range: -		Unit: -		Default: 00000	000 Hex
Size: 4 bytes (U32) A		Access: RO		PDO map: Possible	

• The executed command code is stored.

6002 Hex	Response Code				
Range: -		Unit: -		Default: 00000000 Hex	
Size: 4 bytes (U32)		Access: RO		PDO map: Possible	

• The command execution results are stored. (OK: 00000000 Hex, NG: FFFFFFF Hex)

6003 Hex	Response Data					
Sub-index 0: Number of entries						
Range: -		Unit: -	Default: 01 Hex			

Size: 1 byte (U8)		Access: RO		PDO map: Not possible
Sub-index 1: Response Data				
Range: -	Unit: -		Default: 00000000 Hex	
Size: 4 bytes (BOOL)		Access: RO		PDO map: Possible

• The response data of results from command execution are stored. (E.g.: The scene number is stored when the command "Get scene number" is performed.)

6004 Hex	Error Code				
Range: -		Unit: -		Default: 00000	000 Hex
Size: 4 bytes (L	J32)		Access: RO		PDO map: Possible

6005 Hex	DINT Result Data					
Sub-index 0: N	umber of entries					
Range: -		Unit: - Default: 00 Hex				
Size: 1 byte (U8)			Access: RO		PDO map: Not possible	
Sub-index 1 to 64: DINT Result Data 0-63						
Range: -		Unit: -		Default: 00000000 Hex		
Size: 4 bytes (BOOL) Access: RO PDO map: Po					PDO map: Possible	

• The output data is stored.

6006 Hex	LREAL Result Data						
Sub-index 0: Number of entries							
Range: -		Unit: - Default: 00 Hex					
Size: 1 byte (U8)			Access: RO		PDO map: Not possible		
Sub-index 1 to 32: LREAL Result Data 0-31)							
Range: -		Unit: -		Default: 00000000 Hex			
Size: 8 bytes (U8)			Access: RO		PDO map: Possible		

• The output data is stored.

6007 Hex	User Output Area						
Sub-index 0: Number of entries							
Range: -		Unit: -		Default: 00 Hex	<u>C</u>		
Size: 1 byte (U8	3)	Access: RO			PDO map: Not possible		
Sub-index 1: Us	ser Output Area	0					
Range: -		Unit: -		Default: 000000	000 Hex		
Size: 4 bytes (II	NT32)		Access: RO		PDO map: Possible		
Sub-index 2: User Output Area 1							
Range: -		Unit: -		Default: 00000000 Hex			
Size: 4 bytes (II	NT32)	Access: RO			PDO map: Possible		
Sub-index 3: Us	ser Output Area	2					
Range: -		Unit: -		Default: 00000000 Hex			
Size: 4 bytes (II	NT32)		Access: RO		PDO map: Possible		
Sub-index 4: Us	ser Output Area	3					
Range: -		Unit: -		Default: 000000	000 Hex		
Size: 4 bytes (II	NT32)	Access: RO			PDO map: Possible		
Sub-index 5: User Output Area 4							
Range: -		Unit: - Default: 000			000 Hex		

Access: RO			PDO map: Possible
5

Range: True (1) or False (0)	Unit: -		Default: False (	(0)
Size: 1 bit (BOOL)		Access: RW		PDO map: Possible

- This object controls the Sensor Controller.
- Command Request bit: Turned ON to execute a command.
- Trigger bit: Turned ON to execute a measurement.
- · Flow Command Request bit: Turned ON to execute a command during execution of PLC Link, Fieldbus, or normal flow control.
- Error Clear bit: Turned ON to clear the Error Status bit (3001 Hex, sub-index 17).
- Result Set Request bit: Turned ON to request data output.
- When you use the Sysmac Studio, he sub-index 1 including the above all bits are mapped.

7001 Hex	Command Code					
Range: -		Unit: -			Default: 00000000 Hex	
Size: 4 bytes (E	300L)	Access: RW			PDO map: Possible	

• A command code such as Switch Scene is stored.

7002 Hex	Command para	Command parameter					
Sub-index 0: N	umber of entries						
Range: -		Unit: -		Default: 00 Hex	< Contract of the second s		
Size: 1 byte (U	8)		Access: RO		PDO map: Not possible		
Sub-index 1: C	ommand Parame	eter 0					
Range: -		Unit: -		Default: 00000	000 Hex		
Size: 4 bytes (INT32) Access: F		Access: RW		PDO map: Possible			
Sub-index 2: C	ommand Parame	eter 1					
Range: -		Unit: -		Default: 00000000 Hex			
Size: 4 bytes (I	NT32)		Access: RW		PDO map: Possible		
Sub-index 3: C	ommand Parame	eter 2					
Range: -		Unit: -		Default: 00000000 Hex			
Size: 4 bytes (I	NT32)		Access: RW		PDO map: Possible		
Sub-index 4: C	ommand Parame	eter 3					
Range: -		Unit: -		Default: 00000	000 Hex		
Size: 4 bytes (I	NT32)		Access: RW		PDO map: Possible		

• The command parameter is stored. (E.g. The scene number is stored when the command "Switch scene" is performed.)

# 内

#### Precautions for Correct Use

Since Command Parameter 3 is the reserved area, it is unavailable. Use Command Parameter 0 to 2.

7003 Hex	User Input Area				
Sub-index 0: N	umber of entries				
Range: -		Unit: -		Default: 00 Hex	(
Size: 1 byte (U	8)		Access: RO	•	PDO map: Not possible
Sub-index 1: U	ser Input Area 0				
Range: -		Unit: -		Default: 00000	000 Hex
Size: 4 bytes (I	NT32)		Access: RW		PDO map: Possible

# 2-2 Communicating by PLC Link

This section describes the communication settings, communication specifications (PLC I/O memory areas and communication commands used in PLC communications), and timing charts during communications, which are required for PLC Link communications between the Sensor Controller and an external device.

#### 2-2-1 Communications Processing Flow

The Sensor Controller communicates with external devices using Ethernet or RS-232C/422 through PLC Link communications.

In Ethernet communications, PLC uses UDP/IP or TCP/IP protocol in PLC Link.

#### **Precautions for Correct Use**

- PLC Link communications can be performed via Ethernet or RS-232C/422, but not both at the same time.
- The Sensor Controller will be a client when you connect with PLC Link via TCP/IP protocol.
  Multiple Sensor Controllers of the FH/FHV series and multiple lines cannot be connected with UDP/IP communications. For multiple Sensor Controllers, or multiple lines, use TCP/IP.
- Do not duplicate settings of FINS/UDP ports in CJ/NJ series to the FH/FHV series Output port number when you use UDP/IP communication to connect OMRON PLC CJ series or NJ/NX series via Ethernet.
- If you connect multiple FH/FHV Sensor Controllers to a FINS/UDP port, PLC communication may be disabled. A PLC link error may occur.
- When PLC CJ series or Machine Automation Controllers of the NJ/NX series produced by OMRON are connected to the Sensor Controllers of the FH/FHV series, use TCP. If you used UDP, PLC Link communications will not be established properly and a PLC Link error may occur.

PLC Link communications allow the PLC to use command and response control method, and data output method after measurements. (Both methods can be performed at once.)

In PLC Link communications, the following three communication areas are set in the PLC.

Command/response	(1) Command	This area is used that you write control commands to perform for
method	Area	the Sensor Controller.
	(2) Response	This area is used to read the performed results of the control
	Area	commands written in the Command Area.
Data output after	(3) Data Output	This area is used to read the data output after measurement was
measurement	Area	performed.

The above three communication ares are assigned to the PLC's I/O memory by setting the *area type* and *address* during setting the communication specifications for the Sensor Controller.

- \*1 : You can use output controls (handshaking) to prevent output data from being externally output from the communications buffer until the Controller (master) turns ON the Result Set Request (DSA) signal to request the output data.
- \*2 : The following processing items ara used to read characters: Character inspection, Barcode, 2Dcode, and OCR
- \*3 : For details of the Output Units outputting measurement data, refer to *Settings Required for Data Output* on page 1-21.

#### Additional Information

The PLC Link protocol communicates using three link areas: Command Area, Response Area, and Data Output Area. It is different from the serial PLC Link protocol used to inter-connect OM-RON PLCs serially.

#### Precautions for Correct Use

In the default settings for PLC Link communications, the data output processing method is set to the same processing used for models prior to the FZ4.

This setting synchronizes the measurement processing and data output processing so that all data output processing finishes when measurement finishes. However, this makes the overall processing time for the measurement flow longer.

If required for your application, change the communications settings to *Asynchronous Output* mode, which performs measurement processing and data output processing in parallel. For details, refer to *Asynchronous Output* on page 2-151.

#### 2-2-2 Communications Settings

The following settings are required to use PLC Link.

#### 2-2-3 Communications Module Settings (Startup Settings)

The communication method used for communication with the Sensor Controller is selected from the communication modules.

- **1** On the Main window, click **Tool System Settings** to open the system settings.
- **2** On the Multiview Explorer on the left, select **System settings Startup Startup setting** and then click the **Communication** tab.

System Settings	Language Setting	Basic	Contructation	Operation mod	
Startup	cangoage bearing	Depre	Communication	operation mod	
Startup setting					
Camera	Communication and	the sector of the			
- Camera connection	Communication and	ule select -			
- Inter-camera setting	Serial(Ethernet)	Serial(Ethernet) PLC Lek(SYSMAC CS(CJ/CP/0ne)(UDP)			
- Output signal setting		Pro-	Cilia a single carcarerron	e)(obr)	
Communication	Serial(RS-232C/422)	Norr	nal		
- Parallel	Parallel				
- RS-232C/422(Normal)	Parattel	Star	dard Parallel VO	-	
- Ethernet(Normal(TCP))	Fieldbas	File	-0.17		
- EtherCAT		C1N0	TUAT .		
Other	Remote Operation	ON			

**3** Select one of the following Communication Modules based on the communication method used to connect with the Sensor Controller and the Unit to be connected, and then click **Apply**.

	Communications Module	Description
Serial (Ethernet)		Performs PLC Link communications via an Ethernet connection.
	PLC Link (SYSMAC	Select this communication module to communicate with an OM-
	CS/CJ/CP/One) (UDP)	RON PLC using the UDP communication protocol.
	PLC Link (SYSMAC	Select this communication module to communicate with an OM-
	CS/CJ/CP/One) (TCP)	RON PLC using the TCP communication protocol.
	PLC Link (MELSEC QnU/Q/	Select this communication module to communicate with a Mit-
	QnAS) (UDP)	subishi Electric PLC using the UDP communication protocol.
	PLC Link (MELSEC QnU/Q/	Select this communication module to communicate with a Mit-
	QnAS) (TCP)	subishi Electric PLC using the TCP communication protocol.
	PLC Link (JEPMC MP)	Select this Communications Module to communicate with a
		Yaskawa Electric PLC.
Seria	I (RS-232C/422)	Performs PLC Link communications using an RS-232C/422
		connection.
	PLC Link (SYSMAC	Select this communication module to communicate with an OM-
	CS/CJ/CP/One)	RON PLC.
	PLC Link (MELSEC QnU/Q/	Select this communication module to communicate with a Mit-
	QnAS)	subishi Electric PLC.

#### Additional Information

Normally select UDP communication module when serial is set as Ethernet. Select TCP communication module if that is the recommended method for your particular communication environment.

4 Click **Data save** in the Toolbar.

Data save

On the Main window, click Function - System restart.

**6** Click **OK** in the System restart dialog box to restart the Sensor Controller. When the Sensor Controller was restarted, the set Communication Module will operate with the default settings.

**7** Set the IP address and other parameters for external devices such as a PLC.

#### Precautions for Correct Use

After you set the Communication Module, always click **Data save** and then restart the Sensor Controller. If the settings are not saved and the Sensor Controller is not restarted, the new Communication Module settings will not be enabled

#### **Additional Information**

You can save the Communication Module settings to a file. Use the System data or System + Scene group 0 data option for saving settings to a file. For details, Refer to Saving Settings Data to the Controller RAM Disk or an External Storage Device in the Vision System FH/FHV Series User's Manual (Cat. No. Z365).

2-2-4 Communication Specifications Settings

# 2-2-4 Communication Specifications Settings

Here, set the communication specifications such as the link areas, baud rate, and data length. The communication settings are performed for Ethernet and RS-232C separately.

If communications were not established even though the settings have been performed, check the setting details and communication status.

For details, refer to 2-2-7 Testing Communications on page 2-163.

#### **Precautions for Correct Use**

• The settings dialog box for the communication specifications will change depending on the Communication Module that you use.

Before you set the communication specifications, select the Communication Module to use with the Sensor Controller in the startup settings.

For details, refer to 2-2-3 Communications Module Settings (Startup Settings) on page 2-129. After you selected the Communication Module, save the settings to the Sensor Controller and restart it.

If you do not restart the Sensor Controller, the selected Communication Module will not be enabled.

- Use the same communication settings for the Sensor Controller and the external device.
- Do not input signals to Ethernet from an external device while setting the Ethernet system settings.

# **Connecting via Ethernet**

1 On the Main window, click Tool - System Settings to open the system settings. Select System Settings and then select Communication → Ethernet (PLC Link (SYSMAC CS/CJ/CP/One)), Ethernet (PLC Link (MELSEC QnU/Q/QnAS)), or Ethernet (PLC Link (JEPMC MP)).

The Ethernet view is displayed.

In the communication setting area, set each items.In the case of Ethernet (PLC Link (SYSMAC CS/CJ/CP/One) (UDP)):

Addaman and the second					
Address setting

Output ID address i					
Output IP address :	0	0	0	0	
Input/Output port No. :	9600				

#### Additional Information

 Sensor Controllers of the FH-1000/2000/3000/5000 series with four or eight Camera inputs have two Ethernet ports.

Set the settings for the two Ethernet ports as follows:

- Communication Module Settings:
- Use the same settings for both ports
- IP Address Setting:

Set a different IP address for each Ethernet port.

The IP address for the top Ethernet port is set in *Address setting*, and the IP address for the bottom Ethernet port is set in *Address setting* 2. Note that the FH prioritizes the bottom port, so when there is a high network load, communication on the top port may be delayed or in some cases communication data may be lost. By using both Ethernet ports simultaneously, you can use the bottom port for PLC Link, Non-procedure, EtherNet/IP, or PROFINET communications with a PLC and the top port for FTP or remote operation communications with an external device.

- The following Sensor Controller type has one Ethernet port:
  - FH-L/FHV series

- FH-1000/3000 series with two camera inputs

In this case, the IP address of the Ethernet port is set in Address setting 2

Setting item	Setting value [Factory default]	Description
Address Settings Address Settings is only for the following series: FH-1000 series (4- and 8-camera types), FH-2000 ser- es, FH-3000 series (4- and 8-camera types), FH-5000 series		Set the IP address for the upper Ethernet port on the Sensor Controller.
	<ul> <li>Obtain an IP ad- dress automatically.</li> <li>[Use the following IP address]</li> </ul>	Set the IP address for the Sensor Controller. When <i>Obtain an IP address automatically</i> is selected, the IP address of the Sensor Con- troller will be automatically obtained. When <i>Use the following IP address</i> is select- ed, set the IP address, subnet mask, and the default gateway address.
IP Address	a.b.c.d a: 1 to 223 b: 0 to 255 c: 0 to 255 d: 0 to 255 d: 0 to 254 [10.5.5.100]	Enter the IP address for the Sensor Control- ler.
Subnet mask	0.0.0.0 to 255.255.255.255 [255.255.255.0]	Enter the subnet mask address.
Default gateway	a.b.c.d a: 1 to 223 b: 0 to 255 c: 0 to 255 d: 0 to 255 [10.5.5.100]	Enter the default gateway address.
DNS server	a.b.c.d a: 1 to 223 b: 0 to 255 c: 0 to 255 d: 0 to 255 [10.5.5.100]	Enter the DNS server address.
Preferred WINS server	a.b.c.d a: 1 to 223 b: 0 to 255 c: 0 to 255 d: 0 to 255 d: 0 to 255 [0.0.0.0]	Enter the WINS server address.
Alternate WINS server	a.b.c.d a: 1 to 223 b: 0 to 255 c: 0 to 255 d: 0 to 255 [0.0.0.0]	Enter the WINS server address.

Setting item	Setting value [Factory default]	Description
FH-1000 series (2-camera type) FH-2000 series		Set the IP address for the lower Ethernet port on the Sensor Controller.
	<ul> <li>Obtain an IP ad- dress automatically.</li> <li>[Use the following IP address]</li> </ul>	
IP Address	a.b.c.d a: 1 to 223 b: 0 to 255 c: 0 to 255 d: 0 to 254 [10.5.6.100]

Default gateway	a.b.c.d a: 1 to 223 b: 0 to 255 c: 0 to 255 d: 0 to 255 d: 0 to 255 [10.5.6.100]	
DNS server	a.b.c.d a: 1 to 223 b: 0 to 255 c: 0 to 255 d: 0 to 255 d: 0 to 255 [10.5.6.100]	
Preferred WINS server	a.b.c.d a: 1 to 223 b: 0 to 255 c: 0 to 255 d: 0 to 255 d: 0 to 255 [0.0.0.0]	Enter the WINS server address.
Alternate WINS server	a.b.c.d a: 1 to 223 b: 0 to 255 c: 0 to 255 d: 0 to 255 d: 0 to 255 [0.0.0.0]	Enter the WINS server address.

2-2-4 Communication Specifications Settings

Setting item		Setting value [Factory default]	Description
In	out and Output settings		
	Output IP Address/TCP Server <sup>*1</sup>	a.b.c.d a: 1 to 223 b: 0 to 255 c: 0 to 255 d: 0 to 254 [0.0.0.0] / [10.5.5.101] <sup>*1</sup>	Enter the IP address for the output destina- tion.
	Input/Output port No.	0 to 65535 [9600] / [9876] <sup>*2</sup>	Set the port number to use for the data input and output with the Sensor Controller.

\*1. When the TCP is used for the connection, TCP Server is displayed. Factory default settings are [10.5.5.101].

\*2. When the TCP is used for the connection, Factory default settings are [9876].

#### **Precautions for Correct Use**

- If the operation mode is set to Multi-line Random-trigger Mode, set a different I/O port number for each line.
- · Change the IP address and subnet mask for Address setting and Address setting 2 as reguired so that each designate a different network address. If the same network address were specified, communications may not be performed correctly.
- Be sure to change the output IP address from its factory default value in accordance with your network environment.

#### 3 Click PLC Link.

The PLC Link view is displayed.

Address	0 to 99999 [200]	Set the first channel address of the Data Output Area.

Setting item	Setting value [Factory default]	Description
Output Control	• None • [Handshaking]	Set whether to provide an interlock with the PLC when the data is performed. None: Data is output regardless of the status for signals from he PLC. The GATE is always OFF. Handshaking: Data is output after the DSA signal from the PLC was checked.

	Setting item	Setting value [Factory default]	Description
A	synchronous Output *2	<ul> <li>Selected</li> <li>[Not selected]</li> </ul>	Selected: Measurement processing and data output processing are performed in parallel. The data output processing does not affect the processing time of the measurement flow. [Not selected] Measurement processing and data output processing are synchronized so that all data output processing is completed at the meas- urement end. This increases the overall processing time for the measurement flow. For details, refer to <i>Asynchronous Output</i> on page 2-151.
Retry	/ interval [ms]	0 to 999999 [10000]	Set the time until when a timeout error will occur because the PLC Link communications are not established with incorrect communi- cation settings or communication cables bro- ken. <sup>*1</sup> After a timeout error occurred, communica- tions with the destination device will be at- tempted with the interval time set in the <i>Retry</i> <i>interval</i> . For details, refer to <i>Data Output Control with</i> <i>Handshaking</i> on page 1-25.
Retry Interval 2 [ms]		0 to 999999 [10000]	When the PLC Link communications fail due to a temporary response delay affected by heavy network loads and the PLC internal status, the command will be re-transmitted to the destination device after the time set in the <i>Retry Interval 2</i> passed. Set the shorter time in the <i>Retry Interval 2</i> than that in the <i>Retry Interval.</i> Normally use the default values.
Polling Cycle [ms]		-1 to 999999 [0]	<ul> <li>-1:</li> <li>When this value is set, polling will not be performed in normal operation. This setting eliminates influence to measurement processing time due to communications (polling) in normal operation. Although commands will not be performed, data output and flow control can be performed.</li> <li>0 to 999999:</li> <li>Set the interval at which the Sensor Controller of the FH/FHV series checks that the Command Execute (EXE) signal from an external device such as PLC, switches from OFF to ON.</li> </ul>

\*1. In the communications using *Handshaking*, a timeout error will also occur if any of the following operations were not performed within the time set this *Retry interval* as well..

- If the DSA signal were not turned ON even after a certain time passed from when measurement has been completed.
- If the DSA signal did not switch from ON to OFF even after a certain time passed from when the GATE signal has switched from OFF to ON.
- If the DSA signal did not switch from OFF to ON even after a certain time passed from when the GATE signal has switched from ON to OFF.

\*2:

#### Precautions for Correct Use

Always set the output control to *Handshaking* for asynchronous output. If you set the output control to *None*, operation will be fixed at the following values: Output time: 100 [ms], Output period: 200 [ms].

If you need a shorter output time and output period when the output control is set to *None*, uncheck the asynchronous output option.

#### Communicate with a Mitsubishi Electric PLC

This increases the overall processing time for the measurement flow. For details, refer to <i>Asynchronous Output</i> on page 2-151.

Setting item	Setting value [Factory default]	Description
Retry interval [ms]	0 to 999999 [10000]	Set the time until when a timeout error will occur because the PLC Link communications are not established with incorrect communi- cation settings or communication cables bro- ken. <sup>*1</sup> After a timeout error occurred, communica- tions with the destination device will be at- tempted with the interval time set in the <i>Retry</i> <i>interval</i> . For details, refer to <i>Data Output Control with</i> <i>Handshaking</i> on page 1-25.
Retry Interval 2 [ms]	0 to 999999 [10000]	When the PLC Link communications fail due to a temporary response delay affected by heavy network loads and the PLC internal status, the command will be re-transmitted to the destination device after the time set in the <i>Retry Interval 2</i> passed. Set the shorter time in the <i>Retry Interval 2</i> than that in the <i>Retry Interval.</i> Normally use the default values.
Polling Cycle [ms]	-1 to 999999 [0]	<ul> <li>-1:</li> <li>When this value is set, polling will not be performed in normal operation. This setting eliminates influence to measurement processing time due to communications (polling) in normal operation. Although commands will not be performed, data output and flow control can be performed.</li> <li>0 to 999999:</li> <li>Set the interval at which the Sensor Controller of the FH/FHV series checks that the Command Execute (EXE) signal from an external device such as PLC, switches from OFF to ON.</li> </ul>

\*1. In the communications using *Handshaking*, a timeout error will also occur if any of the following operations were not performed within the time set this *Retry interval* as well.

- If the DSA signal were not turned ON even after a certain time passed from when measurement has been completed.
- If the DSA signal did not switch from ON to OFF even after a certain time passed from when the GATE signal has switched from OFF to ON.
- If the DSA signal did not switch from OFF to ON even after a certain time passed from when the GATE signal has switched from ON to OFF.

\*2:

#### Precautions for Correct Use

Always set the output control to *Handshaking* for asynchronous output. If you set the output control to *None*, operation will be fixed at the following values: Output time: 100 [ms], Output period: 200 [ms].

If you need a shorter output time and output period when the output control is set to *None*, uncheck the asynchronous output option.

**5** Click **Apply** to apply the settings. Click **Close** to close the System Settings dialog box.

# Connecting via RS-232C

- 1 On the Main window, click Tool System Settings to open the system settings. Select System Settings and then select Communication → RS-232C/422 (PLC Link (SYSMAC CS/CJ/CP/One)) or RS-232C/422 (PLC Link (MELSEC QnU/Q/QnAS)). The serial interface window is displayed.
- **2** In the communication setting area, set each items.

Setting	PLC Link	
Interface :		RS-232C
Baud rate	(bps) :	9600
Data leng	th (bit) :	7
Parity:		Even
Stop bit (b	it) :	2
Flow cont	rol :	None
Timeout (	5] :	5

Setting item	Set value [Factory default]	Description
Interface	<ul> <li>[RS-232C</li> <li>RS-422<sup>*3</sup></li> </ul>	Align the communication specifications with the PLC. When you connect an OMRON's PLC, set it to <i>Host Link</i> communications.
Baud rate [bps] <sup>*1</sup>	<ul> <li>2400</li> <li>4800</li> <li>[9600]</li> <li>19200</li> <li>38400</li> <li>57600</li> <li>115200</li> </ul>	Align the communication specifications with the PLC.
Data length [bit] <sup>*2</sup>	• [7] • 8	
parity Stop bit [bit]	<ul><li>None</li><li>Odd</li><li>[Even]</li></ul>	Align the communication specifications with the PLC.
	• 1 • [2]	

Setting item	Set value [Factory default]	Description
Flow control	• [None] • Xon/Xoff	None: The software does not perform the flow control. If the time in which there is no response from external devices reaches the timeout setting time, a timeout error occurs and an error message is displayed in the window. Moreover, the parallel interface ERROR signal turns ON. Xon/Xoff The software performs the flow control. Data is transmitted according to the Xon/Xoff codes from external devices.
Timeout [s]	<ul><li>1 to 120</li><li>[5]</li></ul>	Set the time in which a timeout error will occur.

\*1. If a baud rate of *38400 bps* or higher were selected, communications may not be established well depending on the cable length because communication speeds or 20 Kbps are not defined in RS-232C standards. In this case, set it to *19200 bps* or lower baud rate.

- \*2. With the RS-232C MELSEC Q series, set the data length to 8.
- \*3. RS-422 is unavailable in the MELSEC Q series and the FH series.

## 3 Click PLC Link.

The PLC Link view is displayed.

# **4** Set the following items.

2-2 Communicating by PLC Link

2

2-2-4 Communication Specifications Settings

- If the DSA signal were not turned ON even after a certain time passed from when measurement has been completed.
- If the DSA signal did not switch from ON to OFF even after a certain time passed from when the GATE signal has switched from OFF to ON.
- If the DSA signal did not switch from OFF to ON even after a certain time passed from when the GATE signal has switched from ON to OFF.

\*2:

#### **Precautions for Correct Use**

Always set the output control to *Handshaking* for asynchronous output. If you set the output control to *None*, operation will be fixed at the following values: Output time: 100 [ms], Output period: 200 [ms].

If you need a shorter output time and output period when the output control is set to *None*, uncheck the asynchronous output option.

**5** Click **Apply** to apply the settings.

Click Close to close the System Settings dialog box.

2-2-4 Communication Specifications Settings

# Asynchronous Output

In *Asynchronous output*, measurement flow and data output processing are performed in parallel. The data output processing does not affect the measurement flow processing.

Clear the option for *Asynchronous output* when you want to perform output in the same way as for FZ4 and former models. This enables synchronous output, which means that the subsequent measurement flow is continuously performed only after the data output processing for the current measurement follow was completed. Although all data output processing finishes at measurement end, this increases the overall processing time for the measurement flow.

"Asynchronous output" Selected

#### Precautions for Correct Use

Always set the output control to *Handshaking* for asynchronous output. If you set the output control to *None*, operation will be fixed at the following values: Output time: 100 [ms], Output period: 200 [ms].

If you need a shorter output time and output period when the output control is set to *None*, uncheck the asynchronous output option.

#### 2-2-5 Output Data Settings (Processing Item Registration)

Here, set the output items and output format to be used in PLC Link.

This processing item is not available in the FHV series. When you set output data in the FHV series, refer to 2-2-6 Setting Output Data (Numerical Values and Character Strings) on page 2-157.

#### Additional Information

When outputting characters read by a processing item such as Barcode, these settings are set in the processing item used to read the characters (Character Inspection, Barcode, or 2DCode). Refer to the descriptions for each processing item for details on the character output settings and output format. (Reference Manual (Cat. No. Z341).)

Character Inspection

Refer to Character Inspection in the Vision System FH/FHV Series Processing Items • Barcode

- Refer to Barcode in the Vision System FH/FHV Series Processing Items
- 2DCode
- Refer to 2DCode in the Vision System FH/FHV Series Processing Items
- OCR

Refer to OCR in the Vision System FH/FHV Series Processing Items

# **Registering Processing Items**

Register the processing items for data output in the measurement flow.

- 1 Click **Edit flow** in the Toolbar.
- 2 Select the **Data Output** processing item in the processing item tree.

### 3 Click Append.

The Data Output processing item is added at the bottom of the unit list (flow).

	0.Camera Image Input
å	1.Search
	2.Data Output

Click Data Output icon and set the data output items and data format.
 For details of the settings, refer to the following.
 Registering the Items to Output on page 2-154

#### Additional Information

The number of items that can be output in a single data output processing item is 8 to 256. If you need to output more data items, use more than one Output Unit.
 If multiple Output Units are registered in the same measurement flow, the data is output to the same destination. If you do not control the output, the output data that was output first will be overwritten by the output data that is output after it.

Use one of the following methods to read each set of output data.

	You can offset the location where the output data is written in the
Offset	Data Output Area for each Output Unit.
Oliset	Set the <b>Offset</b> for the Data Output processing item.
	For details, refer to Output Format (Data Output) on page 2-324.
Controlling data output with handshaking	If handshaking is used to control data output, the timing of output-
	ting the data is controlled by I/O signals.
	Each time that data is output, read the output data and move it to a
	different part of I/O memory in the PLC.
	For details on handshaking, refer to Data Output Control with
	Handshaking on page 1-25.

 Data is output in the order that data output is registered in the measurement flow, i.e., the timing is different for each data output processing item. (Data output is executed in the order that it is executed in the measurement flow.)

For details, refer to Outputting the Measurement Data on page 1-18.

# **Registering the Items to Output**

Set the output data with expressions.

- 1 Click Data Output icon in the measurement unit list (flow).
- **2** In the Item tab area, click **Setting**.

Setting	Output format	
Output data — Number of out	ul data items : 8	٦
No. Comm U 1 2 3 4 5 6		
No. 0 Comment:	Comment view	)
Expression :		1

- **3** In the list, click the output data number to set the expression. The selected output data number is displayed under the list.
- **4** Click next to the expression text box and set the expression.

Specify the processing items, measurement results, and measurement data in the expression. Arithmetic or function calculations can be applied to the measurement data to output. For details of the calculation settings, refer to *Calculation* in the *Vision System FH/FHV Series Processing Items Reference Manual (Cat. No. Z341).* 

- **5** Click for the **Comment** text box and enter the description for the expression. The entered comment will be displayed in the detailed results area on the Main window. For example, *Test* was entered as the comment for the expression 0, *Test* will be displayed instead of *Expression 0* in the detailed results areas on the Main window.
- 6 When you want to output more than nine items, click ... under the **Number of output data** items and change the number of output items for the Output Unit. By default you can output up to eight items, but you can change this to output a maximum of 256 output data items (Max. 1,024 bytes).
- **7** Repeat step 3 to 5 to set expressions for all of the required output data numbers.

#### Additional Information

Example: If the Expression for Output 1 Is Deleted

If you delete one of the expressions that is set for output data 0 through 255, the output numbers for all expressions after the deleted expression will stay the same. However, the actual data output will be output as though the list has been shifted forward for the number of expressions that have been deleted.

To prevent data from being written to the wrong locations, use copy and paste to manually shift the expressions after the deleted number forward.

**Output Item Settings** Data Output Destination (Data Output Area) Bit First word No. Comment Expression 15 to 0 0 Reference SX U1.SX +10 DATA1 (Reference SX) 1 Reference SY U1.SY +11 2 3 Reference an... Decimal output format	<ul><li> [Fixed point]</li><li>Floating point</li></ul>	<ul> <li>Use the floating point when you need precision up to four digits decimal point.</li> <li>Fixed point <ul> <li>Data is output multiplied by 1,000.</li> <li>ex.: For 123.456, it will be 0x0001E240.</li> </ul> </li> <li>Floating point <ul> <li>Data is output in floating point format.</li> <li>ex.: For -123.4567,</li> <li>it will be 0xc2f6e979.</li> </ul> </li> </ul>
Offset	0 to 99999 [0]	Set the number of offset channels in the Data Output Area.

### 2-2-6 Setting Output Data (Numerical Values and Character Strings)

### **Registering Processing Items**

Register the processing items for data output in the measurement flow.

1 In the Main window, click **Edit flow** in the Toolbar.

### 2

Click **Result output (I/O)** in the processing item tree.

### **3** Click **Append**.

The Result output (I/O) processing item is added at the bottom of the unit list (flow).

4 Click **Result output (I/O)** icon in the unit list (flow) or **Set** to set the output device and the output data.

### Setting the Output Device

Here, set a communication method when data is output.

1 Click **Result output (I/O)** icon in the unit list (flow) or **Set** to set the output device and the output data.

The Result output (I/O) setting window is displayed.

0	1. Result output (I / O)						$\times$
	Output setting						
N		Data Type	Data	Value	Title		
0							
Ļ							
	A V Inser	t Delete E	Edit				
							~
	][				ок	Cancel	
					UN	Cancel	

### 2 Click Output setting.

The Output setting window is displayed.

Output setting		
Output device : Not selected		~
	ОК	Cancel

**3** Click at the right side of the **Output device** text box to select the communication method to use.

Output setting		
Output device :	Not selected	
	Not selected Serial(Ethernet) Serial(RS-232C/422) Fieldbus	

#### **Precautions for Correct Use**

- The displayed output device is determined based on the selection of **Communication module** in the **System settings** in the item tab.
- Executing measurements without an output device selected causes a failure (NG: No measurement) in the judgment of the processing unit.

### Setting the Output Data

Here, set the data to output such as processing item data or fixed character strings.

1 In the item tab area, click **Output data**.

The Result output (I/O) setting window is displayed.

a) Setting data display area

The No. (output number), Offset (indicating the byte position from the beginning), Data type (integer, double, string), Data, Value, and Title (data description) are displayed in this area. A value is displayed when a variable is assigned to data.

b) Output data display area

Contents in the output data display area in binary (Hex) are displayed in this area.

c) Button

Button	Description
	Moves the selected data up one position.
•	Moves the selected data down one position.
Insert	Adds new data to the selected data position.
Delete	Deletes the selected data. The following data moves up after the deletion.
Edit	Edits the selected data.

Button	Description
ОК	Saves the current settings and returns to the previous view.
Cancel	Discards the current settings and returns to the previous view.

2 In the list, select the output data number to set the output and then click **Insert**. The following **Output data editing** dialog box is displayed.

Output data editing			
Data Type	Data	Title	
	~	_ A4	-
String setting			
Size:	10		
Character code:	0		
	When using language depe	ndent characters, please specify the code page according to that language.	
L			
		ОК	Cancel

s	Setting item	Setting value [Factory default]	Description	
		Integer		
Data	a type	Double	Sets the data type.	
		String		
			There are two input methods. <sup>*1</sup>	
Data		-	- Enter strings directly	
			Assign variables	
Title		-	Enters the description for data.	
Strir	ng settings		Valid when String is selected in the Data type.	
	0 to 4,095	0 to 4,095	Sets the number of characters.	
	Size	[10]		
	Character code	[0]	Sets the code page according to the language to be used.	

\*1. Any arithmetic expression cannot be used. If it is used, it will be handled as character strings.

• Character code: Specify the following code page for each language.

Language	Code page	Language	Code page	Language	Code page
Japanese	932	English	1252	Chinese (simplified)	936
German	1252	French	1252	Chinese (traditional)	950
Italian	1252	Spanish	1252	Korean	949
Vietnamese	1258	Polish	1250		

• The default 0 is no language-dependent letters in ANSI code page.

• If non-existing code page is selected, corresponding data is handled as invalid data (NULL).

**3** Click at the right side of the **Data type** text box to select the data to output. *Integer, Double,* or *String* are selectable.

Data type	Description
Integer	<ul> <li>Entered data is handled as four-byte data.</li> <li>Allowable entering range is a range of signed INT.</li> <li>When string variables are specified for data, character strings like digits which can be converted into numerical values will be converted and output.When decimal digits are included, they are truncated.Moreover, they are handled as "0" if they are not convertible.</li> </ul>
Double	<ul> <li>Entered data is handled as eight-byte data.</li> <li>The allowable entering range is a range of eight-byte floating decimal value.</li> <li>When string variables are specified for data, character strings like digits which can be converted into numerical values will be converted and output. Moreover, they are handled as "0" if they are not convertible.</li> </ul>
String	<ul> <li>Entered data is set based on specified <i>Size</i>. Example: Size is four and the entered data is ABCD. ABCD → ABC+NULL</li> <li>The number of allowable entering characters is up to 4,095. If this limit is exceeded, nothing is displayed and output.</li> <li>When NULL is included in the entered character string, the character string following NULL is not output.</li> <li>The following escape sequence codes can be entered. The entered escape sequence codes are handled as fixed character strings. N: Carriage return, \r: Line feed, \t: Tab, \xXX: ASCII code specified by "XX" (numerical value), \": Double quotation mark, \\: Backslash</li> </ul>

4 Enter data into *Data* text box.

Data that can be output with one data No. is a range only to be handled as one string.

- When directly entering an output content into the **Data** text box.
   A string enclosed with " " (double quotation marks) handled as one string and the rest following it is not output.
   Example: "AA"TEST → only "AA" is output.
- 2) In the case where assignment variable is assigned o data:

Directly enter a variable name (Scene variable: SC.~) or specify a variable in Variable

assignment window displayed by clicking

- Only one variable is valid for one data No.
   Example: SC.A\$+SC.B\$ → Only SC.A\$ is output.
- When a fixed string, e.g. AA, is entered before a variable, the subsequent variable is also handled as a fixed string.
  - Example: AA+SC.AA&  $\rightarrow$  "AA+SC.AA&"
- When "String" is selected in the "Data type" but "Integer" or "Double" is set to the variable, then the variable is converted to a string and then output.

	Y			
Variable name	Туре	Туре	Comment	1
Do not assign				
SC.AAA&	Scene	Integer		
SC.BBB#	Scene	Double		
SC.CCC\$	Scene	String		
SC.DDD&(0)	Scene	Integer array		
SC.EEE#(0)	Scene	Double array		
SC.FFF\$(0)	Scene	String array		
SY.MOJIRETSU\$	System	String		
SY.SYSTEM_A&	System	Integer		
SY.SYSTEM_B&	System	Integer		
SY.SYSTEM_C&	System	Integer		
SY.SYSTEM_D&	System	Integer		

**5** Enter *Title* that indicates the content of output data.

When String is selected in Data type, the following items in String setting area also needs to be set.

String setting
Size: 10 -
Character code: 0 -
When using language dependent characters, please specify the code page according to that language.

#### Example:

1. Resu	ult output (I / O)				_	
-	utsetting					_
Outp	ouseung					
No. 0	Offset 0	Data Type Double	Data SY.SYSTEM_A&	Value 173	Title

7 Click **OK** in the end of entering data to close the settings.

### 2-2-7 Testing Communications

Here, check whether or not the PLC Link communication settings are correct. If communications cannot be established after the setup, use the following procedures to check the setting details and the communication status.

## Communicating via Ethernet

### • Before Testing Communications

Here, *Serial (Ethernet) - PLC Link (SYSMAC CS/CJ/CP/One) (UDP)* communication module is used as an example to describe the procedures.

When checking the communication settings, stop the program on the PLC.

### Checking Communication Settings

Use the following procedures to check whether or not the communication settings are correct.

Address sett ing Obtain an IP address automatic Use the following IP address IP address:	ally	5 _ 5 _	100		<ol> <li>On the Main Window, select [Tool] – [System Settings]. Select [System data], and then select [Communication] – [PLC Link (SYSMAC CS/CJ/CP/One) (UDP)].</li> </ol>
Subnet mask: Default gateway: DNS server: Preferred WINS server : Alternate WINS server :	255 - 24 10 - 10 - 10 - 10 - 10 - 10 - 10 - 10 -	55     255       5     5       6     6       0     0       0     0		- 2	<ol> <li>Set the IP address of the Sensor Controller. The default settings are as follows: Address setting: 10.5.5.100</li> </ol>
Address setting 2 Obtain an IP address automatic Use the following IP address IP address: Subhet mask: Default gateway:	10 2552!	5 _ 6 _ 55 _ 255 _ 6 _ 6 _			Address setting 2: 10.5.6.100
DNS server: Preferred WINS server : Alternate WINS server :	0_	5 - 6 - 0 - 0 - 0 - 0 -		— 3	<ol> <li>Sets IP address for PLC communication to the [Output IP address].</li> </ol>
Output IP address : Input/Output port No. :	0 _   9600 _	00	0	4	<ol> <li>Set the port number to use for data I/O with the PLC in [Input port/Output port No.].</li> <li>Set the same number as the destination PLC.</li> </ol>

### **Precautions for Correct Use**

Be sure to match the settings on the PLC for the *Output IP address* and *Input port No.*. If these settings do not match those on the PLC, PLC Link Error will be displayed on the Sensor Controller.

Setting PLC	Link	5. Click the [PLC Link settings] tab.
Command area Area : Address :	CIO Area(CIO)	<ul> <li>6. Set the area settings.</li> <li>Match these settings with those on the destination PLC.</li> </ul>
Response area Area : Address :	CIO Area(CIO)	
Data Output area Area : Address :	CIO Area(CIO)	
Output control :	Handshaking	<ul> <li>7. Set the output control. Set whether to provide an interlock with the PLC when performing data output.</li> </ul>
Retry interval [ms] : Retry interval 2 [ms] : Polling cycle :	10000 _ < > 1000 _ < > 0 _ < >	8. This completes the Controller settings.

#### Checking the Communication Status

Use the ping command to check whether or not the Sensor Controller exists on the Ethernet network.

With it, check that the Sensor Controller IP address has been correctly set and is correctly connected to the Ethernet network.

#### **Additional Information**

The ping command uses the ICMP protocol to send a response request to a device connected through an Ethernet network and determines the time required to respond to that request. If you properly receive a response from the destination device, the network connection and network settings are correctly set.

1 Connect the Sensor Controller and a computer with an Ethernet cable.

Set the high-order digits of the computer IP address to the same values as the Sensor Controller and the low-order one digit to a different value.

#### <IP Address Setting Example>

Device	Example					
Sensor Controller	10.5.5.100 (default)					
Computer	10.5.5.101					

2

Open the Windows command prompt on the computer and perform the ping command. At the > prompt, type *ping*, followed by a space and the Sensor Controller IP address, and then press *Enter*.

Example:

C:\>ping 10.5.5.100

**3** After a few seconds, *Reply from* followed by the IP address of the Sensor Controller (e.g., 10.5.5.100) are displayed, it means that the Sensor Controller is connected to the Ethernet network properly.

2-2-7 Testing Communications

Example: Reply from 10.5.5.100: byte=32 Time<1 ms TTL=128

If anything other than *Reply from* is displayed:

The Sensor Controller is not connected to the Ethernet network for some reason. Check the following.

- Are the high-order three digits of the IP addresses for the computer and the Sensor Controller the same?
- Is the Ethernet cable correctly connected?
- **4** Use the ping command to check the communication status of the PLC as well. After you have confirmed the communication status as described above, transmit a measurement command to the Sensor Controller in practice to check the communication operations as the Vision Sensor.

### Communicating via RS-232C/422

### Before Testing Communications

Here, Serial (RS-232C/422) - PLC Link (SYSMAC CS/CJ/CP/One) (UDP) communication module is used as an example to describe the procedures.

When checking the communication settings, stop the program on the PLC.

### Checking Communication Settings

Use the following procedures to check whether or not the communication settings are correct.

System Settings			
	Setting PLC Link		3. Click the [PLC Link settings] tab.
Commen     Commen     Comment     Comment connection     Inter-camera setting     Communication     Paralel     R5-322(H2/PLC Link(MELSEC OnU/Q/QAAS))     EtherHeyP     Comment/PLC Link(SYSMAC CS/CU/POne))     Comment     Comment/PLC Link(SYSMAC CS/CU/POne))     Comment     Comment     Comment     Comment     Comment     Comment     Comment     Comment	Command area         Area :         CIO Area(CIO)           Address :	• • •	<ol> <li>Set the area settings.Set these settings based on the connected PLC.</li> </ol>
- STEP setting - Encoder trigger setting - Network drive setting - Screen capture setting - Measurement setting - Loging setting - Operation log setting - User customization	Data Output area       Area :       CIO Area(CIO)       Address :       Output control :       Handshaking       Retry interval [ms] :       Retry interval [ms] :       Polling cycle :		<ol> <li>Set the output control.</li> <li>Set whether to provide an interlock with the PLC when performing data output.</li> </ol>
			6. This completes the Sensor Control- ler settings.

### • Checking the Communication Status

- 1 Connect the Sensor Controller and PLC with a RS-232C/422 cable.
- **2** When the cable is not connected, check that an error message of *PLC Link Error* will be displayed on the Sensor Controller screen.
- **3** When the cable is connected properly, check that the error message of *PLC Link Error* will disappear.

(At the longest, the message should disappear after the time set as the "Retry interval" passed.)

If the error message of PLC Link Error did not disappear, the PLC Link settings are incorrect.

Check the following.

- · Are the communication parameters for connected devices properly set?
- Is the cable correctly connected?
- · Are all cables wired correctly?

After you have confirmed the communication status as described above, transmit a measurement command to the Sensor Controller in practice to check the communication operations as the Vision Sensor.

### 2-2-8 Memory Allocation

Here, describe allocation for each area for Command Area, Response Area, and Data Output Area.

### • Command Area (PLC to Sensor Controller)

First chan-								В	it								
nel in Command Area	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	Event name
+0								X E X E								E X E	Control in- put
+1																D S A	(2CH)
+2 +3	СМЕ	CMD-CODE										Command Code (2CH)					
+4																	
+5																	
+6 +7																	
+8																	Command parameters
+9	CME	)-PAR/	۹M														(Variable
+10										length)							

Signal	Signal name	Function
EXE	Command Request Bit	Performs a command. For details, refer to 2-2-11 Command List on page 2-175.
DSA	Data Output Request Bit	Requests the next data output. For details, re- fer to 2-2-5 Output Data Settings (Processing Item Registration) on page 2-152.
XEXE	Flow Command Request Bit	Performs a flow command.
CMD-CODE	Command Code	Stores the command code.
CMD-PARAM	Command parameters	Store the command parameters.

### • Response Area (Sensor Controller to PLC)

#### Additional Information

Ħ

The order in which data is stored depends on the manufacturer of the connected PLC. For details, refer to *A-1-1 Parameter Notation Examples for Command Control* on page A-2.

First chan-								В	it								
nel in Re- sponse Area	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	Name
+0						X W A I T	X B U S Y	X F L G							B U S Y	F L G	Control in- put
+1																G A T E	(2CH)
+2 +3	СМЕ	CMD-CODE										Command Code (2CH)					
+4 +5	RES	-COD	E														Response Code (2CH)
+6																	
+7	-																
+8	-																Response
+9 +10	RES	RES-DATA									Data (Variable length)						

Signal	Signal name	Function
FLG	Command Completion Bit	Turns ON when command execution is completed.
GATE	Data Output Completion Bit	Turns ON when data output is completed.
BUSY	Command Busy Bit	Performs when command execution is in prog- ress.
XFLG	Flow Command Completion Bit	Turns ON when flow command execution is complete.
XBUSY	Flow Command Busy Bit	Turns ON when flow command execution is in progress.
XWAIT	Flow Command Wait Bit	Turns ON when flow command execution is possible.
CMD-CODE	Command Code	Returns the executed command code.
RES-CODE	Response Code	Stores the response for the executed com- mand.

Signal	Signal name	Function			
RES-DATA	Response Data	Stores the response data for the executed			
	licopolico Dala	command.			

#### • Data Output Area (Sensor Controller to PLC)

Data to be output into the Data Output Area is not automatically allocated. Data to be output is individually allocated to an Output Unit

First chan-								В	it								
nel in Data Output Area	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	Name
+0		DATAO										Output data					
+1		/ 10															0
+2	DAT	-Λ 1															Output data
+3																	1
+4		DATA2										Output data					
+5	DAI											2					
+6		DATA3										Output data					
+7	DAI	AJ															3
+8	DAT	- ^ /															Output data
+9	DAI	A4															4
+10		- ^ E															Output data
+11	DAT	AD															5
+12																	Output data
+13		DATA6									6						
+14	DAT	A7 <sup>*1</sup>															Output data 7

Signal	Signal name	Function
DATA 0 to 7	Output data 0 to 7 <sup>*1</sup>	The data set in the output processing item is output. When more than one processing item exists, data is overwritten on this area by performing handshaking.

\*1. For PLC Link, the number of data items to be output at once can be extended up to 256. Set the number of output data items for each *Output Data* processing item. By changing the default value for *the number of output data items* in the *Data Output* processing item from *8* to the maximum of *256*, you can output up to DATA255.

Data storage in the PLC I/O memory depends on the connected PLC.

For details, refer to Memory Display Image on PLC I/O in the *Vision System FH/FHV Series User's Manual (Cat. No. Z365).* 

### 2-2-9 I/O Signals

### • Input Signals

0.1		-	ON/OFI	F timing
Signal	Signal name	Function	OFF to ON	ON to OFF
EXE	Command Re- quest Signal	The user (PLC) turns this signal ON when is- suing a command to the Sensor Controller.	The user (PLC) turns this signal ON when is- suing a command (in- struct the execution) to the Sensor Controller based on the command code and command pa- rameters.	The user (PLC) switches this signal from ON to OFF when the Sensor Controller turns the Command Completion (FLG) sig- nal ON. <sup>*1</sup>
DSA (Used only for hand- shaking output control)	Data Output Re- quest Signal	During handshaking, the user (PLC) issues this signal to the Sen- sor Controller to re- quest to output exter- nally the measured re- sults performed in the measurement flow. When this signal is ON while an Output Unit (Data Output Unit) in the measurement flow is performed, the Sen- sor Controller outputs the data of the process- ing item.	<ul> <li>The user (PLC) turns this signal ON when requesting the measurement data to output externally.</li> <li>This signal is turned ON at the same time as the Trigger (STEP) or Command Request (EXE) signal switches from OFF to ON. When more than one Output Units is used to output data, turn ON this signal again after the GATE signal for the first data output turns OFF. For details, refer to 2-2-14 Timing Chart on page 2-184.</li> </ul>	The user (PLC) switches this signal from ON to OFF when the Sensor Controller turns the Request Completion (EXE) sig- nal ON. <sup>*2</sup>
XEXE	Flow Command Request Bit	This signal is turned on when a command will be performed while PLC Link flow control is performed.	This signal switches from OFF to ON when an entered command execution is instructed while PLC Link flow control is performed.	This signal switches from ON to OFF when the Flow Command Completion (XFLG) sig- nal is turned ON.

\*1. If this EXE signal does not switch from ON to OFF within the "Retry interval" time set in the Ethernet -PLC Link or RS-232C/422 - PLC Link settings after the Command Completion (FLG) signal was turned ON, a timeout error will occur, and the FLG and BUSY signals are forced to be turned OFF.

\*2. If this DSA signal does not switch from ON to OFF within the "Retry interval" time set in the Ethernet -PLC Link or RS-232C/422 - PLC Link settings after the Result Completion (GATE) signal was turned ON, a timeout error will occur, and the measurement data prepared for output will be discarded. 2-2-9 I/O Signals

### • Output Signals

0.1			ON/OFF timing	
Signal	Signal name	Function	OFF to ON	ON to OFF
BUSY	Busy Signal	This signal indicates that external inputs such as a command cannot be accepted. Be sure to issue com- mands under the condi- tion which this signal is OFF. Note: • This will not be de- tected while com- mands received through any other protocol are process- ed. (Ex.: This signal re- mains OFF during measurements with the STEP signal in the Parallel commu- nications.) If you use more than one proto- col and need to de- tect command exe- cution, use the BUSY signal in Par- allel. • "ON" of this signal does not mean that a command is current- ly performed. To check whether a command is being executed, check the Command Comple- tion (FLG) signal.	The Sensor Controller of the FH/FHV series turns the signal ON when it receives a com- mand from the user (PLC). (After the EXE signal switches from OFF to ON.)	This signal is turned OFF when the user (PLC) turns the Com- mand Request (EXE) signal.
FLG	Command Com- pletion Signal	The Sensor Controller of the FH/FHV series uses this signal to in- form the PLC that a command has been completed.	The signal is turned ON when the Sensor Con- troller of the FH/FHV series completes exe- cution of a received command.	This signal is turned OFF when the user (PLC) switches the Command Request (EXE) signal from ON to OFF.

Signal	Signal Signal name Function			ON/OFF timing		
Signal	Signal name	Function	OFF to ON	ON to OFF		
GATE (Used only for hand- shaking output control)	Data Output Completion Sig- nal	The signal informs the PLC of the timing to load output data. "ON" of this signal indi- cates that the Sensor Controller is outputting the data. The user (PLC) starts to load data when the signal turns ON.	<ul> <li>The signal is turned ON after the Sensor Controller of the FH/FHV series per- forms the Output Unit (Data Output Unit) in the measure- ment flow <sup>*1</sup> and is ready for the data output.</li> <li>Without handshak- ing, this signal al- ways remains OFF.</li> </ul>	This signal is turned OFF when the user (PLC) switches the Re- sult Set Request (DSA) signal from ON to OFF.		
XFLG	Flow Command Completion Bit	This signal indicates that a command per- formed has been com- pleted during PLC Link flow control performed.	This signal is turned ON when a command performed has been completed (XBUSY switched from ON to OFF) during PLC Link flow control performed.	This signal is turned OFF when the Flow Command Busy (XEXE) signal switches from ON to OFF.		
XBUSY	Flow Command Busy Bit	The signal indicates that a command input is in execution during PLC Link flow control performed.	The signal switches from OFF to ON when a command input is in execution during PLC Link flow control per- formed.	This signal automatical- ly switches from ON to OFF when the Flow command Busy Bit (XEXE) has switched from On to OFF.		
XWAIT	Flow Command Wait Bit	This signal indicates that a command input can be accepted during PLC Link flow control performed.	This signal switches from OFF to ON when a command can be en- tered during PLC Link flow control performed.	This signal switches from ON to OFF when a command cannot be entered during PLC Link flow control per- formed.		

\*1. This occurs when the Output Unit is performed after the measurement flow was performed in order from the top, not the moment which measurement execution was completed.

### 2-2-10 Output Items

### Measurement Results for which Output is Possible (Data Output)

The following data can be output using the processing items related to the Result Output. Measurement values are also referred using processing units such as expressions.

Measurement items	Character string	Description
Judgment	JG	Judgment result
Data 0 to 255	D000 to D255	Results of expressions that are set for output data 0 to 255.

### **External Reference Tables (Fieldbus Data Output)**

By specifying a number, the following data can be referred using control commands or processing items having a set and/or get processing unit data function.

Number	Data name	Set/Get	Data range
0	Judgment	Get only	0: No judgment (unmeasured) 1: Judgment result OK -1: Judgment result NG
136	Communication method	Set/Get	0: Ethernet 1: RS-232C/RS-422
137	Output format	Set/Get	0: ASCII 1: Binary
138	Digits of integer	Set/Get	1 to 10
139	Digits of decimal	Set/Get	0: 0 to 4: 4
140	Minus	Set/Get	0: -, 1: 8
141	Field separator	Set/Get	0: OFF, 1: Comma, 2: Tab, 3: Space, 4: Delimiter
142	Record separator	Set/Get	0: OFF, 1: Comma, 2: Tab, 3: Space, 4: Delimiter
143	0 (zero) suppress	Set/Get	0: No, 1: Yes
144 to 147	Output IP Address 1 to 4 (Only for <i>Ethernet</i> )	Set/Get	Destination IP Address
149	Output IP Address Setting (Only for <i>Ethernet</i> ) page 2-174	Set/Get	0: Reference to system 1: Individual specification
150	Output format (Fixed or Floating point)	Set/Get	0: Fixed point 1: Floating point
151	Offset	Set/Get	0 to 99999
152	Number of output data items (Only for PLC Link)	Set/Get	8 to 256
153	Plus	Set/Get	0: No, 1: +
1000 to 1255	Data 0 to 255	Get only	ASCII -999999999999999 to 999999999999999999999

#### Additional Information

If you are using external reference numbers 5 to 12 on an FZ4 or earlier model, use 1000 to 1007 on the FH/FHV.

### 2-2-11 Command List

The following tables list the commands used in PLC Link communications.

For details, refer to A-1-4 Command Details for PLC Link, EtherNet/IP, EtherCAT, and PROFINET on page A-15.

#### Execution Commands

First word in Response Area		Function	Reference
+3	+2		
0010	1010	Performs measurement one time.	page A-15
0010	1020	Performs continuous measurement.	page A-15
0010	1030	Ends continuous measurements.	page A-16
0010	1040	Performs test measurement for the specified unit.	page A-16
0010	2010	Clears all measurement result values.	page A-17
0010	3010	Saves the current system data and scene group data in the Sensor Controller.	page A-19
0010	4010	Registers the model again.	page A-20
0010	5010	Shifts the image display position by the specified amount.	page A-21
0010	5020	Zooms the image display in or out by the specified factor.	page A-21
0010	5030	Returns the display position and display magnification to their default values.	page A-22
0010	7010	Copies the scene data.	page A-24
0010	7020	Deletes the scene data.	page A-25
0010	7030	Moves the scene data.	page A-25
0010	8010	Registers the specified image data as a registered image.	page A-26
0010	8020	Loads the specified registered image as the measurement image.	page A-27
0010	9010	Responds to the Response Area +6 and +7 with the data set in the Command Area +4 and +5.	page A-27
0010	A010	Adds a user account to a specified group ID.	page A-28
0010	A020	Deletes a specified user account.	page A-29
0010	B010	Branches to the start of the measurement flow (processing unit 0).	page A-30
0010	F010	Restarts the Sensor Controller.	page A-30

### • Commands to Get Status

First word in Response Area		Function	Reference
+3	+2		
0020	1000	Gets the current scene number.	page A-31
0020	2000	Gets the current scene group number.	page A-31
0020	4000	Gets the number of the layout that is currently displayed.	page A-32
0020	5010	Gets the number of the Unit that is currently displayed in the specified image display window.	page A-33
0020	5020	Gets the sub-image number that is currently displayed in the specified image display window.	page A-33
0020	5030	Gets the image mode for the specified image display win- dow.	page A-35
0020	7010	Gets the input status (prohibited/permitted) for the Commu- nications Modules.	page A-35
0020	7020	Gets the output status (prohibited/permitted) to an external device.	page A-36
0020	8010	Gets the ON/OFF status for the specified parallel I/O termi- nal.	page A-38
0020	8020	Gets the ON/OFF status of all parallel terminals except for DI terminals.	page A-40
0020	8030	Gets the ON/OFF status of all parallel DI terminals.	page A-42
0020	9000	Gets the user name for the user account currently logged in.	page A-43
0020	9010	Gets the group ID for the account currently logged in.	page A-45
0020	A000	Gets the current state of the operation log.	page A-45

### • Commands to Set Status

First word in Response Area		Function	Reference
+3	+2		
0030	1000	Switches to the specified scene number.	page A-46
0030	2000	Switches to the scene group with the specified number.	page A-46
0030	4000	Sets the layout number and switches the image.	page A-48
0030	5010	Sets the number of the Unit to display in the specified im- age display window.	page A-49
0030	5020	Sets the number of the sub-image to display in the specified image display window.	page A-49
0030	5030	Sets the image mode for the specified image display win- dow.	page A-50
0030	7010	Permits/prohibits inputs to the Communications Modules.	page A-51
0030	7020	Permits/prohibits outputs to external devices.	page A-52
0030	8010	Sets the ON/OFF status of the specified parallel I/O termi- nal.	page A-52
0030	8020	Sets the ON/OFF status of all parallel terminals except for DO terminals.	page A-55

First word in Response Area		Function	Reference
+3	+2		
0030	8030	Sets the ON/OFF status of all parallel DO terminals.	page A-57
0030	9000	Switches the currently logged in account.	page A-58
0030	A000	Sets the state of the operation log.	page A-60

### • Commands to Read Data

First word in Response Area		Function	Reference
+3	+2		
0040	1000	Gets the specified processing unit data.	page A-60
0040	2000	Gets the date and time.	page A-61
0040	3000	Gets the Sensor Controller version information.	page A-62

2-2-12 Command Response Processing

### 2-2-12 Command Response Processing

About control command response processing, the following timing chart describes the ON/OFF timing of signals related to commands to be input.

### • Timing Chart for Command Execution

The Command Request (EXE) signal is used as the trigger to input and execute various commands such as measurement execution stored in advance in the PLC memory. The Command Completion (ELC) signal turns ON when execution of the control command is co

The Command Completion (FLG) signal turns ON when execution of the control command is completed. Use this as the trigger to turn OFF the Command Request (EXE) signal.

- (1) The PLC sets the command code and command parameters.
- (2) After checking that the BUSY signal and the Command Completion (FLG) signal have turned OFF, the PLC turns ON the Command Request (EXE) signal again to instruct the Sensor Controller to perform it.
- (3) When receiving the instruction, the Sensor Controller performs the command and turns ON the BUSY signal.
- (4) When completing the execution, the Sensor Controller sets the command code, response code, and response data.
- (5) The Command Completion (FLG) signal is turned ON.
- (6) The PLC (user) turns OFF the Command Request (EXE) signal when the Command Completion (FLG) signal turns ON.
- (7) When detecting that the Command Request (EXE) signal is OFF, the Sensor Controller automatically turns OFF the Command Completion (FLG) signal and the BUSY signal.
- \*1 : A timeout error occurs and the Command Completion (FLG) signal and BUSY signal are forced OFF if the Command Request (EXE) signal is not turned OFF from the PLC (user) within the time set in the PLC Link settings (*Retry interval: 0 to 999999 [ms]* for Ethernet PLC Link, or *Timeout: 1 to 120 [s]* for RS-232C/422-PLC Link).

#### Timing Chart for Execution of Continuous Measurement Commands (Without handshaking)

Continuous execution is used to repeatedly execute measurement by starting the next measurement operation (image input and measurement processing) as soon as single measurement operation (image input and measurement processing) is completed.

Continuous measurement is started when the Start Continuous Measurements command is executed and ended when the End Continuous Measurements command is executed.

Although the BUSY signal remains OFF during continuous measurement, the Sensor Controller can receive only the End Continuous Measurements command in this state.

- \*1 : When detecting that the Command Completion (FLG) signal turned ON, the PLC (user) turns OFF the Command Request (EXE) signal.
- \*2 : The FLG signal and BUSY signal are forced OFF if the EXE signal is not turned OFF within the Retry Interval after the FLG signal turns ON.

#### <Operation to Start Continuous Measurements>

- (1) The PLC (user) sets the Start Continuous Measurements command code.
- (2) The Command Request (EXE) signal is then turned ON and the instruction is sent to the Sensor Controller.
- (3) When receiving the instruction, the Sensor Controller starts to prepare continuous measurement by turning ON the BUSY signal.
- (4) When completing the preparations for continuous measurement, the Sensor Controller sets the command code and response code. when preparations for continuous measurement have been completed.
- (5) The Command Completion (FLG) signal is turned ON.
- (6) The PLC (user) turns OFF the Command Request (EXE) signal when the Command Completion (FLG) signal turns ON.
- (7) After detecting that the Command Request (EXE) signal has turned OFF, the Sensor Controller starts continuous measurement.

- (8) The Command Completion (FLG) signal and the BUSY signal are then automatically turned OFF.
- \*1 : A timeout error occurs and the Command Completion (FLG) signal and BUSY signal are forced OFF if the Command Request (EXE) signal is not turned OFF from the PLC (user) within the time set in the PLC Link settings (Retry interval: 0 to 999999 [ms] for Ethernet PLC Link, or Timeout: 1 to 120 [s] for RS-232C/422-PLC Link).

#### <Operation to End Continuous Measurement>

- (9) The PLC (user) sets the Start Continuous Measurements command code.
- (10) The Command Request (EXE) signal is then turned ON and the instruction is sent to the Sensor Controller.

Continuous measurement are ended.

### **Additional Information**

Continuous measurement is not ended in the middle of measurement. When the End Continuous Measurements command was executed, continuous measurement is ended after the measurement in execution was completed.

### <Ending Continuous Measurement>

- The Sensor Controller sets the command code and response code when the continuous measure-(11) ment stop.
- The Command Completion (FLG) signal is turned ON. (12)
- (13) When detecting that the Command Completion (FLG) signal turns ON, the PLC (user) turns OFF the Command Request (EXE) signal.
- (14) After detecting that the Command Request (EXE) signal has turned OFF, the Sensor Controller automatically turns OFF Command Completion (FLG) signal.

### **Precautions for Correct Use**

- The measurement during continuous measurement is given priority. Therefore, display of the measurement results (total judgment, images, judgment for each processing unit in the flow display, and detailed results) may sometimes not be updated.
- When continuous measurement is ended, the measurement results from the last measurement will be displayed.

### 2-2-13 Data Output

This section describes the ON/OFF timing for signals related to measurement data output after measurement completion using the following timing chart.

#### • Without handshaking

- (1) The Sensor Controller outputs data when the Data Output Unit starts execution.
- (2) Data is output each time that the Data Output Unit is performed for the second time or other Data Output Unit is performed. In that time, the output data for the first time is overwritten.
   Therefore, use the offset function of PLC Link when performing multiple Data Output Units without handshaking.
   For details, refer to *Output Format (Data Output)* on page 2-324.

#### • With handshaking

The Result Completion (GATE) signal switches from OFF to ON when the PLC (user) switches the Result Set Request (DSA) signal from OFF to ON.

At that time, data that is possible to output will be output.\*1

The PLC (user) switches the DSA signal from ON to OFF under the conditions whether it has received the output data and the Result Completion (GATE) signal has been turned ON.

In the case where multiple Data Output Units perform the data output, the PLC (user) needs to turn the Result Set Request (DSA) signal ON again to instruct next data output when the Sensor Controller switched the Result Completion (GATE) signal from ON to OFF.

\*1: Data prepared for output which an Output Unit has been already performed in the measurement flow.

- \*: A timeout error will occur if the following state exceeds the time, **Retry interval** for Ethernet PLC Link setting and **Timeout** for S-232C/422-PLC Link setting, set in the PLC Link settings.
  - If the DSA signal is not turned ON after a certain time passed from when measurement is finished. (Turn the DSA signal ON at the same time as the measurement trigger command is issued.)
  - If the DSA signal did not switch from ON to OFF even after a certain time passed from when the GATE signal has switched from OFF to ON.
  - If the DSA signal did not switch from OFF to ON even after a certain time passed from when the GATE signal has switched from ON to OFF.
- (1) The PLC (user) turns ON the Command Request (EXE) signal and the Result Set Request (DSA) signal at the same time. The output data for the first Data Output Unit can be surely received.
- (2) The Sensor Controller performs the Data Output Unit in the measurement flow. Since the Result Set Request (DSA) signal is ON, the Result Completion (GATE) signal becomes ON and the output data from the Data Output Unit is output to the external device.
- (3) The PLC (user) reads the data when the Result Completion (GATE) signal turns ON and it turns OFF the Result Set Request (DSA) signal.
- (4) The Sensor Controller automatically turns OFF the Result Completion (GATE) signal when it detects that the Result Set Request (DSA) signal has turned OFF.
- (5) If there is more than one Data Output Unit in the measurement flow, the PLC (user) turns ON the Result Set Request (DSA) signal when the Result Completion (GATE) signal turns OFF, and then waits for execution of the next Data Output Unit.
- (6) When the next Data Output Unit is executed, the GATE signal turns ON and the data is output. Receive the second output data and then repeat steps 3 to 5, above. Repeat steps 3 to 5 for any other data outputs.

### 2-2-14 Timing Chart

This section describes the ON/OFF timing for signals related to the sequence of operation from control command input until measurement data output after measurement completion using the following timing chart.

## • Example 1: Inputting a Measurement Command after Switching a Scene without Handshaking

- (1) The PLC sets the command code and command parameters for the Switch Scene.
- (2) Next, confirm that the BUSY signal and the Command Completion (FLG) signal have turned OFF and then turn ON the Command Request (EXE) signal. A request is sent to the Sensor Controller.
- (3) The Sensor Controller turns ON the BUSY signal and switches the scene when the request is received.
- (4) The Command Completion (FLG) signal is turned ON when the scene switching is completed.
- (5) The PLC (user) turns the Command Request (EXE) signal OFF when the Command Completion (FLG) signal is switched from OFF to ON.
- (6) When the Sensor Controller detects that the Command Request (EXE) signal is OFF, it automatically turns OFF the Command Completion (FLG) signal and the BUSY signal.
- (7) The measurement command code and command parameters are set from the PLC.
- (8) The Command Request (EXE) signal is turned ON to execute the measurement command.

#### Additional Information

To execute a measurement trigger after changing the scene, first confirm that the Command Completion (FLG) signal and the BUSY signal that turned ON for execution of the Select Scene command have turned OFF.

Also, if the BUSY signal is ON for too little time and the external device cannot read it, increase the time that the BUSY signal is ON for changing scenes so that the external device can read the ON state. To do this, change the *Add time* setting for the *Scene switch time*.

Refer to Setting the Conditions That Are Related to Operation during Measurement in the Vision System FH/FHV Series User's Manual (Cat. No. Z365).

- (9) The Sensor Controller turns ON the BUSY signal and executes measurement processing when the request is received.
- (10) The Command Completion (FLG) signal is turned ON when the measurement processing was completed.
- (11) The PLC (user) turns the Command Request (EXE) signal OFF when the Command Completion (FLG) signal turns ON.
- When the Sensor Controller detects that the Command Request (EXE) signal is OFF, it automatically turns OFF the Command Completion (FLG) signal and the BUSY signal.
   When the Command Request (EXE) signal does not switch from ON to OFF within the *Retry interval* time set in the Ethernet PLC Link or the *Timeout* time set in the RS-232C/422 PLC Link settings, a timeout error will occur, and the FLG and BUSY signals are forced to be turned OFF.

### Example 2: Outputting Data with more than one Output Unit Without Handshaking

- (1) The measurement command code and command parameters are set from the PLC.
- (2) Next, confirm that the BUSY signal and the Command Completion (FLG) signal have turned OFF and then turn ON the Command Request (EXE) signal. A request is sent to the Sensor Controller.
- (3) The Sensor Controller turns ON the BUSY signal and executes measurement processing when the request is received.
- (4) When the first Data Output Unit in the measurement flow is executed, the output data for the first Data Output Unit is output to the position at the specified offset in the Data Output Area.
- (5) When the second Data Output Unit in the measurement flow is executed, the output data for the second Data Output Unit is output to the position at the specified offset in the Data Output Area. If no offset has been set, the data will overwrite the data from the first Data Output Unit in the same Data Output Area.
- (6) The Command Completion (FLG) signal is turned ON when the measurement processing was completed.
- (7) The PLC (user) turns the Command Request (EXE) signal OFF when the Command Completion (FLG) signal turns ON.

When the Sensor Controller detects that the Command Request (EXE) signal is OFF, it automatically turns OFF the Command Completion (FLG) signal and the BUSY signal.
 When the Command Request (EXE) signal does not switch from ON to OFF within the *Retry interval* time set in the Ethernet - PLC Link or the *Timeout* time set in the RS-232C/422 - PLC Link settings, a timeout error will occur, and the FLG and BUSY signals are forced to be turned OFF.

#### **Additional Information**

#### Saving All of the Measurement Results

If you output data from more than one Data Output Unit or for repeatedly measured output data (e.g., for continuous measurements), the same Data Output Area will be overwritten. If you want to save all output data, use one of the following methods.

Method	Description
Offset (PLC Link Com-	When using more than one Output Unit, you can offset the write destination of
munications Only)	the output data for each Output Unit.
	Set the <b>Offset</b> for the Data Output processing item.
	For details, refer to Output Format (Data Output) on page 2-156.
	This function is enabled when you are performing data output from more than
	one Data Output Unit.
Controlling Data Output	Handshaking lets you control data output by using the GATE signal turning
with Handshaking	ON as a trigger for the data output timing and by turning ON the DSA signal
	to read the output data.
	Each time that data is output (from the second output on), read the output da-
	ta and move it to a different part of I/O memory in the PLC.
	For details, refer to Data Output Control with Handshaking on page 1-25.

You can compare the received number of output data and the number of measurements for continuous measurements to check if all of the measurement results have been received. Use the following method to check the number of measurements that was actually executed.

Application Example

Set a calculation to count the number of measurements that are executed in the measurement flow.

If you set something like [DO+1], each time a measurement is executed (each time the measurement flow is executed), 1 will be added to DO, so the present value of DO will give you the actual number of measurements.

### 2-2-15 PLC Link Troubleshooting

### • Cannot Input to the Sensor Controller (RS-232C/422 Only)

Problem	Cause	Action
No response is received after	The wiring is incorrect.	Check the wiring. Check the cable connections.
sending communication com- mands.	The RS-232C settings are incorrect.	Correct the settings.
No response is received after	Commands are sent while the BUSY signal is ON.	Send commands while the BUSY signal is OFF.
sending communications com- mands. (Communications were	A cable is broken.	Check the cable connections.
properly working previously.)	A connector has been disconnected.	Check the connector connections.

### • No Data is Output from Sensor Controller

Problem		Cause	Action
The GATE signal does not turn ON.		Handshaking is disabled. (The GATE signal is not output when handshaking is not set in PLC Link.)	Set handshaking for the output control in the communication set-tings.
		The DSA signal is not ON (when handshaking is enabled.)	Turn the DSA signal ON from the PLC.
	Ethernet	The output IP address is incorrect.	Set the output IP address correct- ly.
		Wrong wiring or A cable is broken.	Check the wiring. Check the cable.
Data is not out- put at all.	D0 0000/400	A connector has been disconnect- ed.	Check the connector connections.
	RS-232C/422	No Data Output processing items are set in the measurement flow.	Place Data Output processing items in the measurement flow.
		The <i>Output</i> option is not selected in the Adjustment window.	Place a check to the <i>Output</i> option in the Adjustment window.
	Ethernet	The measurement commands have not been accepted.	If the BUSY signal stays OFF after a measurement command is is- sued, the measurement command may have not been accepted. Issue measurement commands only when both of the BUSY and FLG signals are OFF.
Data is some-		A cable is broken.	Check the cable.
times output and sometimes not.	s RS-232C/422	The <i>Output</i> option is not selected in the Adjustment window.	Place a check to the <i>Output</i> option in the Adjustment window.
		The measurement commands have not been accepted.	If the BUSY signal stays OFF after a measurement command is is- sued, the measurement command may have not been accepted. Issue measurement commands only when both of the BUSY and FLG signals are OFF.

Problem	Cause	Action
The read or collated string is not output.	Character output has not been set.	Set character output in the output parameters for the character out- put processing items such as Character Inspection, Barcode, 2DCode. (The output for the read or collat- ed string is set in the above proc- essing items, not in the Data Out- put processing items.)
Although more than one Data Out- put item is set in the measurement flow, data is received from only the last Data Output Unit in the flow.	The data output by the Data Out- put Unit has been overwritten by the next Data Output Unit.	Use handshaking to control the data output or use an offset to store all data.

### • A Timeout Error Occurred

Problem	Cause	Action
A handshaking timeout error oc- curred.	<ul> <li>The timing to switch the DSA signal is too slow.</li> <li>The following patterns are considered.</li> <li>The DSA signal is not turned ON even after measurement has been completed.</li> <li>The DSA signal is not switched from ON to OFF even after the GATE signal has been turned ON.</li> <li>The DSA signal is not turned ON even after the GATE signal has been turned ON even after the GATE signal has been turned ON even after the GATE signal has been turned OFF.</li> </ul>	Turn the DSA signal ON or OFF within the time set as the timeout.
	The DSA signal is not output or detecting its state by the Sensor Controller is late.	Check the timing when the PLC program instructs to output the DSA signal. The signal may not be received correctly due to noise.

### • Slow Operation

Problem	Cause	Action
It takes around 10 seconds to per- form any PLC Link command.	Communications have timed out.	Set the PLC cycle time as short as possible.
	You try to use a wrong combina- tion for communication protocols such as PLC Link and EtherNet/IP or PLC Link and PROFINET.	Use a proper combination for communication protocols.
Response and data output is slow.	Asynchronous output is selected without output control.	To select asynchronous output, set the output control to [Hand- shaking]. Clear the option for Asynchronous output if no output control.

### • A PLC Link Error Occurred

Problem	Cause	Action
A message of "PLC Link Error" is displayed.	You try to use a wrong combina- tion for communication protocols such as PLC Link and EtherNet/IP or PLC Link and PROFINET.	Use a proper combination for communication protocols.
uspiayeu.	The communication settings such as the port settings have been changed on the PLC.	Restart the PLC.

# • The Sensor Controller cannot Communicate with a PLC Properly. (Only for Ethernet)

Problem	Cause	Action
The Sensor Controller cannot communicate with an external de- vice such as a PLC properly. (Only for Ethernet)	The communication settings such as IP address have been changed after the Device information stor- age tool was performed. (The IP addresses for external devices on the network may have overlapped the IP addresses stored in the Sensor Controller.)	Check that the communication settings such as IP address are correct. (Tool menu - System setting - Communication - Ethernet) Perform the Device in- formation storage tool again. The communication settings in the software will be copied in the Sen- sor Controller.

## 2-3 Communicating by EtherNet/IP

This section describes the communication settings, communication specifications, input/output formats, and the communication timing charts during communications, which are required for EtherNet/IP communications between the Sensor Controller and an external device.

### 2-3-1 Introduction to EtherNet/IP

EtherNet/IP is an industrial multi-vendor network using Ethernet.

The specifications are open standards managed by the ODVA (Open DeviceNet Vendor Association). EtherNet/IP is used in a wide range of industrial devices.

Since EtherNet/IP uses standard Ethernet technology, it can be mixed with various general-purpose Ethernet devices.

EtherNet/IP has mainly the following features.

- High-speed and high-capacity data exchange through tag data links (Cyclic communication) The EtherNet/IP protocol supports Implicit communications, which allows cyclic communication socalled tag data links with EtherNet/IP devices.
- Tag data links at communication cycle specified for each application regardless of the number of nodes

Since data is exchanged over the network at the update period set for each connection, the update period for communications will not increase even if the number of nodes is increased. (The concurrency of data in connections is maintained.)

Moreover, the update period can be set for each connection, each application can communicate at its optimum update period. (ex.: Interprocess interlocks can be transferred at high-speed, while production instructions and the status monitor information for production processes are transferred at low-speed.

#### **Precautions for Correct Use**

- On a network to which many devices are connected, performance may drop (e.g., responses may be delayed or packets lost) or communications errors may occur when there is temporarily high traffic on the network. Test the operation under actual conditions before you start actual operation of the system.
- Since a reasonable amount of measurement takt time is required to have stable communications in an operation under high load, verify the operation under the conditions that are to be actually applied.
- Use Ethernet connector 2 (the bottom connector) to perform EtherNet/IP communications with the following series:
  - FH-1000 series (4 and 8 camera type)
  - FH-2000 series
  - FH-3000 series (4 and 8 camera type)
  - FH-5000 series
  - You cannot use EtherNet/IP communications with Ethernet connector 1 (the top connector).
- Connection using Multi-line Random Trigger Mode is not possible with some PLCs. In Multiline Random Trigger Mode, the sensor controller assigns a connection to each line. On some PLCs, multiple connections cannot be set. Check and verify the PLC specifications prior to use.
- When using EtherNet/IP communications in Multi-line Random-trigger mode with three lines or more, recommend using FH-3000/5000 series because it is likely to be a high-load state.

### 2-3-2 Data Exchange with EtherNet/IP

### Communications with EtherNet/IP

Data is cyclically exchanged between Ethernet devices on the EtherNet/IP network with tag data links below.

#### Data exchange method

To exchange data, a connection is opened between two EtherNet/IP devices.

One of the nodes requests the connection to open a connection with a remote node.

The node that requests the connection is called the *Originator*, and the node that receives the request is called the *Target*.

#### Data exchange memory locations

The memory locations used to exchange data across a connection are specified as tags. Memory locations or variables can be specified to tags.

These grouped tags are called an output tag set and input tag set respectively.

#### Additional Information

Message communications are used when communicating with a PLC that does not support tag data link communications or when using functions, such as character string output, that are not supported in tag data link communications.

For details of EtherNet/IP message communications, refer to 2-3-19 Communicating with the Sensor Controller using EtherNet/IP Message Communications on page 2-252.

### EtherNet/IP Communication Cycle (RPI)

The tag data link communications by EtherNet/IP update data at a communication interval called RPI (Requested Packet Interval).

All data exchange between the Sensor Controller and an external device such as a PLC is performed at the set RPI.

As changes in each signal from the Sensor Controller are also affected by the RPI, the target device sometimes may not detect such changes depending on the RPI timing.

Therefore, set the relationship between the output signals from the Sensor Controller and the RPI as follows.

Duration of change in Sensor Controller signal > RPI

#### Precautions for Correct Use

۲Þ

Output signal

Controller

from the Sensor

Sensor Controller

ON

OFF

30 ms

50 ms

Set the RPI to 4 [ms] or higher.

When the RPI is longer than the duration of a Sensor Controller signal change, the signal change may not be detected.

Example 1: Duration of	of Change in Sensor	Controller Signal < RPI

Х

RPI		30 ms
Sensor Controller	Output period	50 ms
	Output time	30 ms (ON: 30 ms, OFF: 20 ms)
	Output control	None
PLC Communications transmission path (EtherNet/IP)		The packet interval (RPI) is too long.

The PLC cannot detect some of the output signals from the Sensor Controller.

30 ms

50 ms

#### Example 2: Duration of Change in Sensor Controller Signal > RPI

The RPI is shorter than the signal time (GATE OFF: 20 [ms]), so the PLC can detect all output signals from the Sensor Controller.

#### Additional Information

Sensor Controller

Set the communications settings as follows:

- Sensor Controller communications settings: Set *Output period* and *Output time* in the Ether-Net/IP settings.
  - For details, refer to Setting the EtherNet/IP Output Specifications on page 2-202.
- RPI setting: Set the RPI using Support Software that can set tag data link settings (e.g., Network Configurator).

For details, refer to 2-3-8 Setting Tag Data Link on page 2-206.

# 2-3-3 EtherNet/IP Communications

With commands and responses via communications between the PLC and the Sensor Controller using EtherNet/IP tag data link, the PLC can control the Sensor Controller and make it output data after measurements.

The Sensor Controller supports EtherNet/IP conformance tests.

The settings for tag data links are performed with the support software dedicated to it.

When you connect to an OMRON Controller to communicate with it via EtherNet/IP, use the Network

Configurator to perform the tag data link settings such as tag, tag set, and connection setting.

This section describes how to use the Network Configurator to perform tag data link settings.

For details of the tag data link settings using Network Configurator, refer to the following manuals.

- NJ-series CPU Unit Built-in EtherNet/IP Port User's Manual (Cat. No. W506)
- CS/CJ series EtherNet/IP Units Operation Manual (Cat. No. W465)
- CJ-series EtherNet/IP Units Operation Manual for NJ-series CPU Unit (Cat. No. W495)

#### **Precautions for Correct Use**

- Since a reasonable amount of measurement takt time is required to have stable communications in an operation under high load, verify the operation under the conditions that are to be actually applied.
- On a network to which many devices are connected, performance may drop (e.g., responses may be delayed or packets lost) or communications errors may occur when there is temporarily high traffic on the network. Test the operation under actual conditions before you start actual operation of the system.
- When the measurement interval is short, the measurement processing load is high, or command processing for operations such as scene group changing is time-consuming, the Sensor Controller prioritizes measurement processing and control processing over communication processing. As a result, communication between an external device and the Sensor Controller may be temporarily interrupted, and a communication error may occur.
   In this case, set the communication error timeout time longer than the Sensor Controller's

processing time, or lengthen the measurement interval. Set the communication error timeout time in the tag data link connection settings<sup>\*1</sup>as follows:

*Timeout value* > Measurement time on Sensor Controller.

\*1: Use Support Software, such as the Network Configurator, to change the tag data link connection settings.

For details of setting the tag data links using the Network Configurator, refer to 2-3-8 Setting Tag Data Link on page 2-206.

# 2-3-4 Communications Processing Flow

In EtherNet/IP communications, the following five communication areas are set in the PLC.

Input tag set for the	(1) Command Area (Command/response method)	This area is used that you write control com- mands to perform for the Sensor Controller.
Sensor Controller	(2) User Input Area 0	This area is used that you write the data that you defined for the Sensor Controller.
	(3) Response Area (Command/response method)	This area is used that the Sensor Controller writes the results which the control commands written in the Command Area were performed.
Output connection to PLC	(4) Data Output Area (Data output after measurement)	This area is used that the Sensor Controller writes the output data accompanied with the measurement after measurement performed.
	(5) User Output Area	This area is used that the Sensor Controller writes the data that you defined.

The above five areas are set by Support Software that can perform tag data link settings such as Sysmac Studio Ver. 1.10 or later, or Network Configurator. How to specify is either I/O memory addresses or variable names.

For details of the tag data link settings by Network Configurator, refer to 2-3-8 Setting Tag Data Link on page 2-206.

Moreover, when a non-OMRON PLC or EtherNet/IP unit is connected, download the EDS file for the Sensor Controller from our OMRON website and follow the procedures in the user's manual for the external devices to be connected and in the instruction for the software to set tag data link.

The flow of EtherNet/IP communications between a PLC and the Sensor Controller is as follows.

- \*1 : The Response Area (3) and Data Output Area (4) are assigned to continuous memory addresses or to variables.
- \*2 : You can use output controls (handshaking) to prevent output data from being externally output from the communications buffer until the PLC (master) turns ON the Result Set Request (DSA) signal to request the output data.
- \*3 : For details of the Output Units outputting measurement data, refer to *Settings Required for Data Output* on page 1-21.
- \*4 : Use the Macro Customization Function to input and output to the User Area. For details of the Macro Customization Function, refer to *EtherNet/IP communication of the IO Module List* in the *Vision System FH/FHV Macro Customize Functions Programming Manual (Cat. No. Z367).*

# 2-3-5 Communications Settings

The following settings are required to use EtherNet/IP communications.

## **2-3-6** Communications Module Settings (Startup Settings)

The communication method used for communication with the Sensor Controller is selected from the communication modules.

- **1** On the Main window, click **Tool System Settings** to open the system settings.
- **2** On the Multiview Explorer on the left, select **System settings Startup Startup setting** and then click the **Communication** tab.

System Settings ⊟- Startup	Language Setting	Basic	Communication	Operation mode
Startup setting				
⊟ Camera				
Camera connection	Communication mo	dule select —		
-Inter-camera setting	Serial(Ethernet)	hlore	nal(UDP)	
- Output signal setting		Inou	iai(UDP)	
Communication	Serial(RS-232C/422)	Norm	nal	
Parallel	Devellet			
RS-232C/422(Normal)	Parallel	Stan	dard Parallel I/O	
Ethernet(Normal(UDP))	Fieldbus	Ethe	'Net/IP	
EtherNet/IP		Jectro -	INOME	
🚊 Other	Remote Operation	ON		-
Date-time setting		1		

- **3** In the Communication Module Selection Area, select *EtherNet/IP* in the *Fieldbus*, and then click **Apply**.
- 4 Click Data save in the Toolbar.

Data save

- **5** On the Main window, click **Function System restart**.
- 6 Click OK in the System restart dialog box to restart the Sensor Controller. When the Sensor Controller was restarted, the set Communication Module will operate with the default settings.
- 7 Set the IP address and other parameters for external devices such as a PLC.

#### Precautions for Correct Use

After you set the Communication Module, always click **Data save** and then restart the Sensor Controller. If the settings are not saved and the Sensor Controller is not restarted, the new Communication Module settings will not be enabled

#### Additional Information

You can save the Communication Module settings to a file. Use the *System data* or *System* + *Scene group 0 data* option for *saving settings to a file*. For details, Refer to *Saving Settings Data to the Controller RAM Disk or an External Storage Device* in the *Vision System FH/FHV Series User's Manual (Cat. No. Z365)*.

# 2-3-7 Communication Specifications Settings

Set the output handshaking and output controls for communications.

# 内

#### Precautions for Correct Use

• Set the Communications Module to *EtherNet/IP* in the startup settings before setting the communications specifications.

For details, refer to 2-3-6 Communications Module Settings (Startup Settings) on page 2-198. After you select the Communications Module, save the settings to the Sensor Controller and restart the Sensor Controller. If you do not restart the Sensor Controller, the selected Communications Module will not be enabled.

Furthermore, if the operation mode is set to the Multi-line Random-trigger Mode, the Communications Modules for lines 1 and higher must also be set to *EtherNet/IP*.

- When using Multi-line Random-trigger Mode, specify different addresses for the sending and receiving areas for each line.
- After the tag data link was set, the Sensor Controller automatically restarts to reflect the setting.

# **Setting IP Address**

- **1** On the Main window, click **Tool System Settings** to open the system settings.
- In the tree view on the left, select System Settings Communication Ethernet Normal (xyz) ("xyz" depends on the Communication Module).
   The Ethernet view is displayed.

#### **3** Set each item.

#### **Additional Information**

 Sensor Controllers of the FH-1000/2000/3000/5000 series with four or eight Camera inputs have two Ethernet ports.

Set the settings for the two Ethernet ports as follows:

- Communication Module Settings:
- Use the same settings for both ports
- IP Address Setting:

Set a different IP address for each Ethernet port.

The IP address for the top Ethernet port is set in *Address setting*, and the IP address for the bottom Ethernet port is set in *Address setting* 2. Note that the FH prioritizes the bottom port, so when there is a high network load, communication on the top port may be delayed or in some cases communication data may be lost. By using both Ethernet ports simultaneously, you can use the bottom port for PLC Link, Non-procedure, EtherNet/IP, or PROFINET communications with a PLC and the top port for FTP or remote operation communications with an external device.

• The following Sensor Controller type has one Ethernet port:

- FH-L/FHV series

- FH-1000/3000 series with two camera inputs

In this case, the IP address of the Ethernet port is set in Address setting 2

Setting	g item	Setting value [Factory default]	Description
FH-1000 series	is is only for the (4- and 8-camer	following series: ra types), FH-2000 ser- amera types), FH-5000	Set the IP address for the upper Ethernet port on the Sensor Controller.
		<ul> <li>Obtain an IP ad- dress automatically.</li> <li>[Use the following IP address]</li> </ul>	Set the IP address for the Sensor Controller. When <i>Obtain an IP address automatically</i> is selected, the IP address of the Sensor Con- troller will be automatically obtained. When <i>Use the following IP address</i> is select- ed, set the IP address, subnet mask, and the default gateway address.
IP Address		a.b.c.d a: 1 to 223 b: 0 to 255 c: 0 to 255 d: 0 to 254 [10.5.5.100]	Enter the IP address for the Sensor Control- ler.
Subnet mas	k	0.0.0.0 to 255.255.255.255 [255.255.255.0]	Enter the subnet mask address.
Default gate	way	a.b.c.d a: 1 to 223 b: 0 to 255 c: 0 to 255 d: 0 to 255 [10.5.5.100]	Enter the default gateway address.

Setting item	Setting value [Factory default]	Description
DNS server	a.b.c.d a: 1 to 223 b: 0 to 255 c: 0 to 255 d: 0 to 255 [10.5.5.100]	Enter the DNS server address.
Preferred WINS server	a.b.c.d a: 1 to 223 b: 0 to 255 c: 0 to 255 d: 0 to 255 d: 0 to 255 [0.0.0.0]	Enter the WINS server address.
Alternate WINS server	a.b.c.d a: 1 to 223 b: 0 to 255 c: 0 to 255 d: 0 to 255 d: 0 to 255 [0.0.0.0]	Enter the WINS server address.

	Setting item	Setting value [Factory default]	Description
Ac FH FH	ldress Settings 2 ldress Settings is only for the l-1000 series (2-camera type) l-3000 series (2-camera type) ries	, FH-2000 series,	Set the IP address for the lower Ethernet port on the Sensor Controller.
		<ul> <li>Obtain an IP ad- dress automatically.</li> <li>[Use the following IP address]</li> </ul>	
	IP Address	a.b.c.d a: 1 to 223 b: 0 to 255 c: 0 to 255 d: 0 to 254 [10.5.6.100]	
	Subnet mask	0.0.0.0 to 255.255.255.255 [255.255.255.0]	Same as "Address Settings".
	Default gateway	a.b.c.d a: 1 to 223 b: 0 to 255 c: 0 to 255 d: 0 to 255 [10.5.6.100]	
	DNS server	a.b.c.d a: 1 to 223 b: 0 to 255 c: 0 to 255 d: 0 to 255 [10.5.6.100]	

Setting item	Setting value [Factory default]	Description
Preferred WINS server	a.b.c.d a: 1 to 223 b: 0 to 255 c: 0 to 255 d: 0 to 255 [0.0.0.0]	Enter the WINS server address.
Alternate WINS server	a.b.c.d a: 1 to 223 b: 0 to 255 c: 0 to 255 d: 0 to 255 [0.0.0.0]	Enter the WINS server address.

# **4** Click **Apply** to finish the settings.

Click **Close** to close the System Settings dialog.

#### **Precautions for Correct Use**

Change the IP address and subnet mask for [Address setting] and [Address setting 2] as required so that each designate a different network address. If the same network address is specified, communications may not be performed correctly.

# Setting the EtherNet/IP Output Specifications

- **1** On the Main window, click **Tool System Settings** to open the system settings.
- $\label{eq:select} 2 \quad \text{Select System Settings} \rightarrow \text{Communication} \rightarrow \text{EtherNet/IP}. \\ \text{The Ethernet view is displayed}.$

#### **3** Set each item.

Judge output polarity:	ON at NG ~	
Error output polarity:	ON at error V	
Output control :	Handshaking ~	
We recommend the use of If "None" is selected, there is not executed properly a	e is a possibility that external device transmit and receive	data
Output period [ms] :		
Output period [ms] :	10.0	

Setting item	Setting value [Factory default]	Description
Judge output polarity	<ul><li>ON at OK</li><li>[ON at NG]</li></ul>	ON at OK: ON when the judgment result is OK. For the overall judgment, ON when all judgment results are OK. ON at NG: ON when the judgment result is NG. For the overall judgment, ON when one of the judgment results is NG.
Error output polarity	<ul><li> [ON at error]</li><li> OFF at error</li></ul>	ON at error: ON when an error occurs. OFF at error: OFF when an error occurs.
Output control	• [None] • Handshaking	Set whether to synchronize with the external device when data is output. Normally, select <i>Handshaking</i> . For details, refer to 2-3-17 Data Output on page 2-247. None: The Sensor Controller outputs measurement results without synchronizing with external devices. Handshaking: The Sensor Controller outputs measurement results with synchronizing with external devices.
Output period [ms]	2.0 to 5000.0 [10.0]	<ul> <li>Valid only when <i>Output control</i> is set to <i>None</i>.</li> <li>Set the cycle by which measurement results are output.</li> <li>Set the period so that the interval is longer than the <i>Output time</i>, but less than the measurement interval.</li> <li>Adjust this value based on the RPI (packet interval) communication cycle in the EtherNet/IP connection settings for the PLC to be connected.</li> <li>For details, refer to <i>EtherNet/IP Communication Cycle (RPI)</i> on page 2-192.</li> </ul>
Output time [ms]	1.0 to 1000.0 [5.0]	Valid only when <i>Output control</i> is set to <i>None</i> . Set the cycle by which measurement results are output. Set the ON time for the GATE signal. Set the time required for an external device to get measure- ment results. Adjust this value based on the RPI (packet inter- val) communication cycle in the EtherNet/IP con- nection settings for the PLC to be connected. For details, refer to <i>EtherNet/IP Communication</i> <i>Cycle (RPI)</i> on page 2-192.

Setting item	Setting value [Factory default]	Description
Timeout [s]	0.5 to 120.0 [10.0]	<ul> <li>Valid only when <i>Output control</i> is set to <i>Handshaking</i>.</li> <li>A timeout error occurs when no response from external devices is received at the following timing within the time that has been set.</li> <li>In the following cases, a timeout error occurs when the state of each signal does not change within the time that has been set.</li> <li>If the DSA signal were not turned ON even after a certain time passed from when measurement has been completed.</li> <li>The DSA signal turns OFF after the GATE flag has turned ON.</li> <li>The DSA signal turns ON after the GATE flag has turned OFF.</li> </ul>
Output data size	Result Data Format 0 (32 bytes) Result Data Format 1 (64 bytes) Result Data Format 2 (128 bytes) Result Data Format 3 (256 bytes)	Set the data size to output as measurement re- sults for each line. The settings are reflected at the restart after they were stored. There are four types in the output data size: 32, 64, 128, and 256 bytes. Result Data Format 0 (32 bytes) Out put data 0 to 7 of 4 bytes can be used and to- tal size of the output data is 32 bytes. Result Data Format 1 (64 bytes) Out put data 0 to 15 of 4 bytes can be used and total size of the output data is 64 bytes. Result Data Format 2 (128 bytes) Out put data 0 to 31 of 4 bytes can be used and total size of the output data is 128 bytes. Result Data Format 3 (256 bytes) Out put data 0 to 63 of 4 bytes can be used and total size of the output data is 256 bytes.
User area	• [None] • ON	<ul> <li>Set whether or not to use the User Area (user input and output areas)</li> <li>Data type of User Input Area 0 to 3 is DINT. Data type of User Input Area 4 to 5 is LREAL.</li> <li>Data type of User Output Area 0 to 3 is DINT. Data type of User Output Area 4 to 5 is LREAL.</li> </ul>

# rh.

# Precautions for Correct Use

#### About Output data size and User Area

All line's Output data size and User Area are necessary to be equal when you select the Multiline random trigger in Operation mode.

# **4** Click **Apply** to apply the settings.

Click **Close** to close the System Settings dialog box.

#### **Precautions for Correct Use**

#### **PLC Connection Timeout Interval**

Set the *PLC connection timeout interval* so that it is longer than the *measurement processing time*. For the timeout value, refer to 2-3-3 *EtherNet/IP Communications* on page 2-194.

# 2-3-8 Setting Tag Data Link

This section describes how to set data links for EtherNet/IP.

The communication areas in the PLC to data-link with the Sensor Controller are specified as tags (tag sets), and the connections are set for tag data link communications.

When you connect to an OMRON Controller to communicate with it via EtherNet/IP, use the Network Configurator to perform the tag data link settings such as tag, tag set, and connection setting.

Here, describes how to set tag data links using the Network Configurator.

For details of the tag data link settings using Network Configurator, refer to the following manuals.

- NJ-series CPU Unit Built-in EtherNet/IP Port User's Manual (Cat. No. W506)
- CS/CJ series EtherNet/IP Units Operation Manual (Cat. No. W465)
- CJ series EtherNet/IP Units Operation Manual for NJ-series CPU Unit (Cat. No. W495)

#### Precautions for Correct Use

- When connecting to a CPU Unit of NJ series or CJ series, install the EDS file that defines the connection information for the Sensor Controller to the Support Software (e.g., Network Configurator). Download the EDS file from our OMRON's website.
- After the tag data link was set, the Vision Sensor is automatically restarted to apply the settings.

# Settings Tags, Tag Sets, and Connection

Here, set each communication area in the PLC as tag data link connections as shown in the following table.

#### • Tag and Tag Set Settings in the PLC

Sotting itom	Descr	iption
Setting item	Command Area	Response Area and Output Area
Type of tags and tag sets	Output tag set	Input tag set
Name of tags and tag sets	I/O memory addresses or variable names	I/O memory addresses or variable names <sup>*1</sup>

Cotting itom	Desci	ription
Setting item	Command Area	Response Area and Output Area
Data size	<ul> <li>The size will be the sum of the size of the Command Area and the User Input Area.</li> <li>20 bytes (When the User Area is not used.)</li> <li>52 bytes (When the User Area is used.)</li> </ul>	<ul> <li>The size will be the sum of the size of the Response Area, Data Output Area, and User Output Area.</li> <li>Result Data Format 0 is selected: <ul> <li>48 bytes (When the User Area is not used.)</li> <li>80 bytes (When the User Area is used.)</li> </ul> </li> <li>Result Data Format 1 is selected: <ul> <li>80 bytes (When the User Area is not used.)</li> </ul> </li> <li>Result Data Format 1 is selected: <ul> <li>80 bytes (When the User Area is not used.)</li> </ul> </li> <li>112 bytes (When the User Area is not used.)</li> <li>112 bytes (When the User Area is used.)</li> <li>Result Data Format 2 is selected: <ul> <li>144 bytes (When the User Area is not used.)</li> </ul> </li> <li>176 bytes (When the User Area is used.)</li> <li>Result Data Format 3 is selected: <ul> <li>272 bytes (When the User Area is not used.)</li> <li>304 bytes (When the User Area is used.)</li> </ul> </li> </ul>

\*1. Specify the top of the I/O memory address in the Response Area.

The Output Area is allocated continuously following the Response Area.

When a variable name is used for it, the specified variable is allocated as including both the Response Area and Output Area.

For information about how to access each signal in the communication area assigned to the variable from the user program, refer to Accessing Communication Areas Using Variables by NJ Series Controllers on page 2-229.

- Settings the Sensor Controller (Device parameters Settings)
  - 1 Right-click the Sensor Controller on the network in the Network Configurator and select **Parameter**  $\rightarrow$  **Edit**.
  - **2** As the Edit Device Parameter dialog box will open, perform the settings as necessary.

Edit Device Parameters	
Parameters	
Parameter Name	Value
All parameters	
0001 Input Size	48
0002 Output Size	20
0003 RPI	10000
	<u>R</u> eset
D <u>e</u> fault Setup	Expand All Collapse All
	OK Cancel

Parameter name	Description	Setting value
0001 Input Size <sup>*1</sup>	The size will be the sum of the size of the Response Area, Data Output Area, and User Output Area.	<ul> <li>Set one of the following values.</li> <li>Result Data Format 0 is selected:</li> <li>48 bytes (When the User Area is not used.)</li> <li>80 bytes (When the User Area is used.)</li> <li>Result Data Format 1 is selected:</li> <li>80 bytes (When the User Area is not used.)</li> <li>112 bytes (When the User Area is used.)</li> <li>Result Data Format 2 is selected:</li> <li>144 bytes (When the User Area is not used.)</li> <li>176 bytes (When the User Area is used.)</li> <li>Result Data Format 3 is selected:</li> <li>272 bytes (When the User Area is not used.)</li> <li>304 bytes (When the User Area is used.)</li> </ul>
0002 Output Size <sup>*2</sup>	The size will be the sum of the size of the Command Area and the User Input Area.	<ul><li>Set one of the following values.</li><li>20 bytes (When the User Area is not used.)</li><li>52 bytes (When the User Area is used.)</li></ul>
0003 RPI <sup>*3</sup>	The required packet interval	10,000

\*1. Although the data size can be set up to 502 bytes, use the above setting.

\*2. Although the data size can be set up to 502 bytes, use the above setting.

\*3. The packet interval (RPI) is set in the connection settings between the PLC and the Sensor Controller. No additional setting is required here.

# Connection Settings

Setting item		Description	
	Input tag set	PLC_tag_set_name - [48 bytes] <sup>*1</sup>	
Originator device (PLC)	Connection type	Any (default: Point to Point connection)	
(FLC)	Output tag set	PLC_tag_set_name - [20 bytes] <sup>*1</sup>	
Target device	Output tag set	Input_101 - [48 Bytes] <sup>*1</sup>	
(Sensor Controller)	Input tag set	Output_100 - [20 Bytes] <sup>*1</sup>	
Packet interval (RPI)		Any (default: 50.0) <sup>*2</sup>	
		Any (default: Packet interval (RPI) x 4)	
Timeout value		Set this value so that it is longer than the measure-	
		ment processing time of the Sensor Controller.	

\*1. Tags and tag sets in the PLC need to be the same.

\*2. Adjust the value based on the communication settings of the Sensor Controller such as the output period and output time.

For details, refer to EtherNet/IP Communication Cycle (RPI) on page 2-192.

#### **Precautions for Correct Use**

- If the CIO memory area that holds contents were not specified when I/O memory addresses are specified for communication areas, the information in each communication area will be cleared when the operating mode of the PLC is changed.
- The settings for the following Assembly Object are required to specify instances without using the EDS file.

Assembly Object Settings:

Setting item	Setting value	Description	Size
Instance	100	Output connection (for normal con- trol and for line 0 in Multi-line Ran- dom-trigger Mode)	The sum of the size of the Command Area and the User Input Area. *1
	101	Input connection (for normal control and for line 0 in Multi-line Random- trigger Mode) for line 0)	The sum of the size of the Response Area, Data Output Area, and User Output Area. *2
	102	Output connection (for line 1 in Multi- line Random-trigger Mode)	The sum of the size of the Command Area and the User Input Area. *1
	103	Input connection (for line 1 in Multi- line Random-trigger Mode)	The sum of the size of the Response Area, Data Output Area, and User Output Area. *2
	104Output connection (for line 2 in Mult line Random-trigger Mode)		The sum of the size of the Command Area and the User Input Area. *1
	105	Input connection (for line 2 in Multi- line Random-trigger Mode)	The sum of the size of the Response Area, Data Output Area, and User Output Area. *2

Setting item	Setting value	Description	Size	
	106	Output connection (for line 3 in Multi- line Random-trigger Mode)	The sum of the size of the Command Area and the User Input Area. *1	
	107	Input connection (for line 3 in Multi- line Random-trigger Mode)	The sum of the size of the Response Area, Data Output Area, and User Output Area. *2	
	108	Output connection (for line 4 in Multi- line Random-trigger Mode)	The sum of the size of the Command Area and the User Input Area. *1	
	109	Input connection (for line 4 in Multi- line Random-trigger Mode)	The sum of the size of the Response Area, Data Output Area, and User Output Area. *2	
110 Output connection (for line 5 in Multi- line Random-trigger Mode)		The sum of the size of the Command Area and the User Input Area. *1		
	111	Input connection for line 5)	The sum of the size of the Response Area, Data Output Area, and User Output Area. *2	
	112	Output connection for line 6 in Multi- line Random-trigger Mode)	The sum of the size of the Command Area and the User Input Area. *1	
	113	Input connection for line 6 in Multi- line Random-trigger Mode)	The sum of the size of the Response Area, Data Output Area, and User Output Area. *2	
	114	Output connection for line 7 in Multi- line Random-trigger Mode)	The sum of the size of the Command Area and the User Input Area.	
	115	Input connection (for line 7in Multi- line Random-trigger Mode)	The sum of the size of the Response Area, Data Output Area, and User Output Area. *2	

- \*1. 20 bytes (When the User Area is not used.) 52 bytes (When the User Area is used.)
- \*2. Result Data Format 0 is selected:
  48 bytes (When the User Area is not used.)

  176 bytes (When the User Area is used.)
  Result Data Format 3 is selected:
  272 bytes (When the User Area is not used.)
  304 bytes (When the User Area is used.)

# 2-3-9 Output Data Settings (Processing Item Registration)

Here, set the output items and output format to be used with EtherNet/IP. This processing item is not available in the FHV series. When you set output data in the FHV series, refer to *2-3-10 Setting Output Data (Numerical Values and Character Strings)* on page 2-216.

# **Registering Processing Items**

Register the processing items for data output in the measurement flow.

- **1** Click **Edit flow** in the Toolbar.
- 2 Select the **Fieldbus Data Output** processing item in the processing item tree.

🕂 📋 Out	put result
🛄	Data Output
🗵	Parallel Data Output
🌆	Parallel Judgement Output
📓	Fieldbus Data Output

# **3** Click **Append**.

The Fieldbus Data Output processing item is added at the bottom of the unit list (flow).

4 Click the Fieldbus Data Output a icon and set the data output items and data format. For details of the settings, refer to the following. Registering the Items to Output on page 2-213

#### Precautions for Correct Use

#### Fieldbus Data Output

Perform the communication settings before the settings of Fieldbus Data Output. Note that if you changed the communication settings after the settings of Fieldbus Data Output, the changed settings will not be displayed on the Fieldbus Data Output setting display.

#### **Additional Information**

• The number of outputtable items for single data output processing item is 8 to 64 depending on data output settings in each line. If you need to output more data items, use more than one Output Unit.

However, the data is output to the same destination, so if you do not control the output, the data that was output first will be overwritten by the followed data. Use the following method to read each set of output data.

	When the output control uses handshaking, the output timing of the data
	can be controlled by I/O signals.
Controlling Data Output	Each time the data is output, read the output data and move it to a different
with Handshaking	part of the I/O memory in the PLC.
	For details of handshaking, refer to Data Output Control with Handshaking
	on page 1-25.
Data is output in the ord	der that processing items for output are registered in the measurement
flow, i.e., the timing is different for each data output processing item. (Data output is executed	

flow, i.e., the timing is different for each data output processing item. (Data output is in the order that it is executed in the measurement flow.)

For details, refer to Outputting the Measurement Data on page 1-18.

2-3-9 Output Data Settings (Processing Item Registration)

# Registering the Items to Output

Set the output data with expressions.

- 1 Click the Fieldbus Data Output 💷 icon in the measurement unit list (flow).
- 2 In the Item tab area, click **Setting**.

...

**3** In the list, click the output data number to set the expression.

Fieldbus Data Output	
Setting Output format	
Output data	×
No. 0 Comment view Comment: Expression: Result: 0.0000	-

The selected output data number is displayed under the list.

4 Click - next to the expression text box and set the expression.

Specify the processing items, measurement results, and measurement data in the expression. Arithmetic or function calculations can be applied to the measurement data to output. For details of the calculation settings, refer to *Calculation* in the *Vision System FH/FHV Series Processing Items Reference Manual (Cat. No. Z341).* 

- 5 Click for the Comment text box and enter the description for the expression. The entered comment will be displayed in the detailed results area on the Main window. For example, *Test* was entered as the comment for the expression 0, *Test* will be displayed instead of *Expression 0* in the detailed results areas on the Main window.
- **6** Repeat step 3 to 5 to set expressions for all of the required output data numbers.

#### **Additional Information**

If you delete one of the expressions that is set for output data 0 through 7, the output numbers for all expressions after the deleted expression will stay the same. However, the actual data output will be output as though the list has been shifted forward for the number of expressions that have been deleted.

To prevent data from being written to the wrong locations, use copy and paste to shift the expressions after the deleted number forward.

For details of the Data Output Area, refer to 2-3-12 Memory Allocation on page 2-224. Example: If the Expression for Output 1 Is Deleted Output Item Settings

Data Output Destination (Data Output Area)

	Einst	Bit
No. Comment Expression	First word	15 to 0
0 Reference SX U1.SX 1 Reference SY U1.SY	+8	DATA1 (Reference SX)
2 Reference an U1.ST	+9	
3	+10	DATA2 (Reference SY)
	+11	
	+12	DATA3 (Reference angle ST)
Output 1 is deleted.	+13	
Output Item Settings	Data Output De	estination (Data Output Area)
No. Comment Expression	First word	Bit
0 Reference SX / U1.SX		15 to 0
	+8	DATA1 (Reference SX)
2 Reference an U1.ST	+9	
3	+10	DATA3 (Reference angle ST)
	+11	
	+12	
	+13	
	expressions re	hbers assigned to the main the same, but the data is shifted forward for data 3.

# **Output Format (Fieldbus Data Output)**

- 1 Click the Fieldbus Data Output I icon in the measurement unit list (flow).
- 2 In the item tab area, click **Output format**.

# **3** Select the output format.

Output Setting Decimal output form :

Fixed point
 C Floating point

Setting item	Setting value [Factory default]	Description
Decimal output format	<ul><li> [Fixed point]</li><li>Floating point</li></ul>	<ul> <li>Fixed point Data is output multiplied by 1,000. ex.: For 123.456, it will be 0x0001E240.</li> <li>Floating point Data is output in floating point format. ex.: For -123.4567, it will be 0xc2f6e979.</li> </ul>

# 2-3-10 Setting Output Data (Numerical Values and Character Strings)

# **Registering Processing Items**

Register the processing items for data output in the measurement flow.

In the Main window, click Edit flow in the Toolbar.

Click **Result output (I/O)** in the processing item tree.

# **3** Click **Append**.

The **Result output (I/O)** processing item is added at the bottom of the unit list (flow).

4 Click **Result output (I/O)** icon in the unit list (flow) or **Set** to set the output device and the output data.

2-3-10 Setting Output Data (Numerical Values and Character Strings)

# Setting the Output Device

Here, set a communication method when data is output.

1 Click **Result output (I/O)** icon in the unit list (flow) or **Set** to set the output device and the output data.

The **Result output (I/O)** setting window is displayed.

👝 1. R	esult output (I / O)					$\square  \times$
0	utput setting					
No.	Offset	Data Type	Data	Value	Title	
0						
	Inser	t Delete E	Edit			
						~
						~
					ок	Cancel

#### 2 Click Output setting.

The Output setting window is displayed.

**3** Click at the right side of the **Output device** text box to select the communication method to use.

Output setting	
Output device:	Not selected ~
	Not selected Serial(Ethernet) Serial(RS-232C/422) Fieldbus

#### **Precautions for Correct Use**

- The displayed output device is determined based on the selection of **Communication module** in the **System settings** in the item tab.
- Executing measurements without an output device selected causes a failure (NG: No measurement) in the judgment of the processing unit.

# Setting the Output Data

Here, set the data to output such as processing item data or fixed character strings.

**1** In

#### In the item tab area, click **Output data**.

The Result output (I/O) setting window is displayed.

Output setting           No.         Offset         Data Type         Data         Value         Title           0	$\times$

a) Setting data display area

The No. (output number), Offset (indicating the byte position from the beginning), Data type (integer, double, string), Data, Value, and Title (data description) are displayed in this area. A value is displayed when a variable is assigned to data.

b) Output data display area

Contents in the output data display area in binary (Hex) are displayed in this area.

c) Button

Button	Description
	Moves the selected data up one position.
•	Moves the selected data down one position.
Insert	Adds new data to the selected data position.
Delete	Deletes the selected data. The following data moves up after the deletion.
Edit	Edits the selected data.

Button	Description
OK	Saves the current settings and returns to the previous view.
Cancel	Discards the current settings and returns to the previous view.

2 In the list, select the output data number to set the output and then click **Insert**. The following **Output data editing** dialog box is displayed.

Output data editing				
Data Type	Data	Title		
	~	<u> </u>		-
String setting				
Size:	10			
Character code:	0			
	When using language dependent cha	racters, please specify the code page according to that la	anguage.	
L		Г		
			ОК	Cancel

S	Setting item	Setting value [Factory default]	Description			
Data	a type	<ul><li>Integer</li><li>Double</li><li>String</li></ul>	Sets the data type.			
Data		_	<ul><li>There are two input methods.<sup>*1</sup></li><li>Enter strings directly</li><li>Assign variables</li></ul>			
Title		_	Enters the description for data.			
Strir	ng settings		Valid when <i>String</i> is selected in the "Data type".			
	Size 0 to 4,095 [10]		Sets the number of characters. The number of characters that can be output depends on the data size setting for the tag and tag-set settings in the PLC.			
	Character code	[0]	Sets the code page according to the language to be used.			

\*1. Any arithmetic expression cannot be used. If it is used, it will be handled as character strings.

• Character code: Specify the following code page for each language.

Language	Code page	Language	Code page	Language	Code page
Japanese	932	English	1252	Chinese (simplified)	936
German	1252	French	1252	Chinese (traditional)	950
Italian	1252	Spanish	1252	Korean	949
Vietnamese	1258	Polish	1250		

- The default 0 is no language-dependent letters in ANSI code page.
- If non-existing code page is selected, corresponding data is handled as invalid data (NULL).
- **3** Click at the right side of the **Data type** text box to select the data to output. *Integer, Double, or String* are selectable.

Data type	Description
Integer	<ul> <li>Entered data is handled as four-byte data.</li> <li>Allowable entering range is a range of signed INT.</li> <li>When string variables are specified for data, character strings like digits which can be converted into numerical values will be converted and output.When decimal digits are included, they are truncated.Moreover, they are handled as "0" if they are not convertible.</li> </ul>
Double	<ul> <li>Entered data is handled as eight-byte data.</li> <li>The allowable entering range is a range of eight-byte floating decimal value.</li> <li>When string variables are specified for data, character strings like digits which can be converted into numerical values will be converted and output. Moreover, they are handled as "0" if they are not convertible.</li> </ul>
String	<ul> <li>Entered data is set based on specified <i>Size</i>. Example: Size is four and the entered data is ABCD. ABCD → ABC+NULL</li> <li>The number of allowable entering characters is up to 4,095. If this limit is exceeded, nothing is displayed and output.</li> <li>When NULL is included in the entered character string, the character string following NULL is not output.</li> <li>The following escape sequence codes can be entered. The entered escape sequence codes are handled as fixed character strings. N: Carriage return, \r: Line feed, \t: Tab, \xXX: ASCII code specified by "XX" (numerical value), \": Double quotation mark, \\: Backslash</li> </ul>

4 Enter data into *Data* text box.

Data that can be output with one data No. is a range only to be handled as one string.

1) When directly entering an output content into the Data text box.

A string enclosed with " " (double quotation marks) handled as one string and the rest following it is not output.

Example: "AA"TEST  $\rightarrow$  only "AA" is output.

2) In the case where assignment variable is assigned o data:

Directly enter a variable name (Scene variable: SC.~) or specify a variable in Variable

assignment window displayed by clicking Marchine ......

- Only one variable is valid for one data No.
   Example: SC.A\$+SC.B\$ → Only SC.A\$ is output.
- When a fixed string, e.g. AA, is entered before a variable, the subsequent variable is also handled as a fixed string.
  - Example: AA+SC.AA&  $\rightarrow$  "AA+SC.AA&"
- When "String" is selected in the "Data type" but "Integer" or "Double" is set to the variable, then the variable is converted to a string and then output.

	Y			
Variable name	Туре	Туре	Comment	
Do not assign				
SC.AAA&	Scene	Integer		
SC.BBB#	Scene	Double

**7** Click **OK** in the end of entering data to close the settings.

# 2-3-11 Testing Communications

Here, check whether or not the EtherNet/IP communication settings are correct. If communications cannot be established after the setup, use the following procedures to check the setting details and the communication status.

# **Before Testing Communications**

Here, *Serial (Ethernet) - Normal (UDP)* communication module is used as an example to describe the procedures.

When checking the communication settings, stop the program on the PLC.

# **Checking Communication Settings**

Use the following procedures to check whether or not the communication settings are correct.

2-3-11 Testing Communications

# **Checking the Communication Status**

Use the ping command to check whether or not the Sensor Controller exists on the Ethernet network. With it, check that the Sensor Controller IP address has been correctly set and is correctly connected to the Ethernet network.

#### Additional Information

The ping command uses the ICMP protocol to send a response request to a device connected through an Ethernet network and determines the time required to respond to that request. If you properly receive a response from the destination device, the network connection and network settings are correctly set.

**1** Connect the Sensor Controller and a computer with an Ethernet cable.

Set the high-order digits of the computer IP address to the same values as the Sensor Controller and the low-order one digit to a different value.

#### <IP Address Setting Example>

Device	Example
Sensor Controller	10.5.5.100 (default)
Computer	10.5.5.101

**2** Open the Windows command prompt on the computer and perform the ping command. At the > prompt, type *ping*, followed by a space and the Sensor Controller IP address, and then press *Enter*.

Example: C:\>ping 10.5.5.100

- 3
  - After a few seconds, *Reply from* followed by the IP address of the Sensor Controller (e.g., 10.5.5.100) are displayed, it means that the Sensor Controller is connected to the Ethernet network properly.

Example: Reply from 10.5.5.100: byte=32 Time<1 ms TTL=128

If anything other than *Reply from* is displayed:

The Sensor Controller is not connected to the Ethernet network for some reason. Check the following.

- Are the high-order three digits of the IP addresses for the computer and the Sensor Controller the same?
- Is the Ethernet cable correctly connected?
- **4** Use the ping command to check the communication status of the PLC as well. After you have confirmed the communication status as described above, transmit a measurement command to the Sensor Controller in practice to check the communication operations as the Vision Sensor.

# 2-3-12 Memory Allocation

This section describes the assignments of the Command Area for the input connection to the Sensor Controller and the Response Area and Output Area for the output connection to the PLC.

# Input Connection to the Sensor Controller (PLC (Originator) to Sensor Controller (Target))

For the input connections to the Sensor Controller, specifies the control inputs, command codes, command parameters, and User Input Area, which are the Command Area parameters.

Signal	Signal name	Function
EXE	Command Execu- tion Bit	Performs a command. For details, refer to 2-3-15 Command List on page 2-239.
DSA	Data Output Re- quest Bit	Requests the next data output. For details, refer to 2-3-9 Output Data Settings (Processing Item Registration) on page 2-211.
STEP	Measure Bit	Performs measurement one time.
XEXE	Flow Command Request Bit	Instructs a command execution during the execution of the Fieldbus flow control.
ERCLR	Error Clear Bit	Clears the ERR signal from the Sensor Controller.
CMD-CODE	Command Code	Stores the command code.
CMD-PARAM	Command parame- ters	Stores the command parameters.
User Input Area 0 to 5	User Input Area 0 5	<ul> <li>This area is used that you write the data that you defined for the Sensor Controller.</li> <li>Data type of User Input Area 0 to 3 is DINT. Data type of User Input Area 4 to 5 is LREAL.</li> </ul>

# Output Connection to PLC (Sensor Controller (Originator) to PLC (Target))

For output connections to the PLC, execution results and output data from the Sensor Controller are set. The execution results such as control outputs, command codes, response codes, and response data are output to the Response Area, and the output data from the Sensor Controller or the User Output Area is output to the Data Output Area.

#### Additional Information

The order in which data is stored depends on the manufacturer of the connected PLC. For details, refer to *A-1-1 Parameter Notation Examples for Command Control* on page A-2.

#### Response Area

First chan-	Bit																
nel in Re- sponse Area	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	Name
+0	E R R					X W A I T	X B U S Y	X F L G			A C K	R U N	O R		B U S Y	F L G	Control out- put (2 CH)
+1																G A T E	
+2		•	•	•				•				•					Command
+3	CME	)-COD	E														Code (2 CH)
+4																	Response
+5	RES-CODE								Code (2CH)								
+6												Response					
+7	RES	RES-DATA									Data (2 CH)						

#### Data Output Area

When the User Area is used, data set as the number of output data in the EtherNet/IP output specifications are output followed by the data of the User Output Area. Therefore, the first channel of the User Output Area will be changed according to the number of output data.

The following table indicates the mapping of the Data Output Area and User Output Area when Result Data Format 0 (32 bytes) is selected as the number of the output data.

First chan-		Bit															
nel in Data Output Area	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	Name

Signal	Signal name	Function
FLG	Command Comple- tion Bit	Turns ON when command execution is completed.
GATE	Data Output Com- pletion Bit	Turns ON when data output is completed.
BUSY	Command Busy Bit	Turns ON when command execution is in progress and turns OFF automatically when the execution was competed.
OR	Overall judgment	Turns ON when the overall judgment is NG. (The OR signal is output only when the <i>Output</i> option is selected in the Adjustment window.)
XFLG	Flow Command Completion Bit	Turns ON when execution of an entered command during the execution for the Fieldbus flow control is completed, i.e. XBUSY: ON to OFF).
XBUSY	Flow Command Busy Bit	Turns ON when an entered command is in execution during the execution of the Fieldbus flow control.
XWAIT	Flow Command Wait Bit	Turns ON when a command can be entered during the execu- tion of the Fieldbus flow control.
RUN	Run Mode	Turns ON when the Sensor Controller is in Run Mode.
ACK	Command Recep- tion bit	Turns ON when Measurement Bit (STEP) or Command Execu- tion Bit is turned ON. Turns OFF after the command execution was completed and either the STEP Bit or EXE Bit is OFF.
ERROR	Error Signal	Turns ON when the Sensor Controller detects an error signal.
CMD-CODE	Command Code	Returns the executed command code.
RES-CODE	Response Code	Stores the response data for the executed command.
RES-DATA	Response Data	Stores the response data for the executed command.

Signal	Signal name	Function
DATA0 to 7	Output data 0 to 7	Outputs the data set in the output processing item. When more than one processing item exists, data is overwritten on this area by performing handshaking.
User Output Area 0 to 5	User Output Area 0 to 5	<ul> <li>This area is used that the Sensor Controller writes the data that you defined using Macro customize functions.</li> <li>Data type of the User Output Area 0 to 3 is DINT. Data type of the User Output Area 4 to 5 is LREAL.</li> </ul>

### Accessing Communication Areas Using Variables by NJ Series Controllers

In Controllers of the NJ series, I/O memory addresses assigned to each communication area can be accessed from the user program only via variables. Follow the procedures below.

### Accessing with Network Variables

Customize and define variables based on the structure of each communication area of the Sensor Controller. Use Sysmac Studio to define the variables.

For operations of Sysmac Studio, refer to *Sysmac Studio Version1 Operation manual (Cat. No. W504)*.

**1** Define the data types for the variables.

Define the data types for the variables based on the structure of each communication area of the Sensor Controller.

 Definition of data type to access a signal First, define the data type for a BOOL array to access the control signals and status signals.

Here, define the data type called *U\_EIPFlag*. Name of data type: U\_EIPFlag Kind of derived data type: Union

	Name of data type	Data type	
U_	EIPFlag	UNION	_
	F	ARRAY[031]OF BOOL	·····Specifies an array of BOOL data from 0 to 31.
	W	DWORD	

- Definition of data type for each communication area access
   Define data types to access each communication area for the Command Area and Response and Output Areas respectively.

   Here, define two kinds of data type: *S\_EIPOutput* and *S\_EIPInput*.
- Data type to access the Command Area Name of data type: S\_EIPOutput Kind of derived data type: Structure

	Name of data type	Data type	
S	_EIPOutput	STRUCT	-
	ControlFlag	U_EIPFlag	·····The data type that was defined above (1)
	CommandCode	DWORD	·····32-bit bit string data
	CommandParam1	DINT	·····32-bit integer data
	CommandParam2	DINT	·····32-bit integer data
	CommandParam3	DINT	·····32-bit integer data

• Assignment example for the variable data type according to the Command Area. For details, refer to *Input Connection to the Sensor Controller (PLC (Originator) to Sensor Controller (Target))* on page 2-224.

 Data type to access the Response and Output Areas Name of data type: S\_EIPInput Kind of derived data type: Structure

Name of data type	Data type	
S_EIPInput	STRUCT	
StatusFlag	U_EIPFlag	·····The data type that was defined above (1)
CommandCodeEcho	DWORD	·····32-bit bit string data
ResponseCode	DWORD	·····32-bit bit string data
ResponseData	DINT	·····32-bit integer data
OutputData	ARRAY[07]OF DINT	······Specifies an array of DINT
		data from 0 to 7.

 Assignment example for the variable data type according to the Response and Output Areas.

For details, refer to *Output Connection to PLC (Sensor Controller (Originator) to PLC (Target)) on page 2-225.* 

### 2 Define variables

Define variables to perform data links for data in each communication area through EtherNet/IP communications.

2-3-12 Memory Allocation

For these variables, the data types defined in step 1 are used.

Variable	Variable type	Network publish attribute	Data type	Application
EIPOutput	Global variable	Output	S_EIPOutput	For data links for the Command Area
EIPInput	Global variable	Input	S_EIPInput	For data links for the Response and Output Areas

Export the variables defined by Sysmac Studio.
 Export the defined variables to use on the Network Configurator.
 An CSV file is created for exporting.

- **4** Set Network Configurator
  - Import the CSV file, which was exported by Sysmac Studio, to Network Configurator. The imported variables are automatically registered as tags.
  - 2) Configure the connections as shown below.

Originator device (PLC) settings	Target device (Sensor Controller) settings
Input tag set: EIPOutput	Output tag set: Input101
Output tag set: EIPInput	Input tag set: Output100

**5** Access each communication area from user program The defined variables are used to access each communication area of the Sensor Controller as shown below.

Command Area

Signal name	Variable name
EXE	EIPOutput.ControlFlag.F[0]
STEP	EIPOutput.ControlFlag.F[1]
XEXE	EIPOutput.ControlFlag.F[8]
ERCLR	EIPOutput.ControlFlag.F[15]
DSA	EIPOutput.ControlFlag.F[16]
Command Code	EIPOutput.CommandCode
Command parameter 1	EIPOutput.CommandParam1
Command parameter 2	EIPOutput.CommandParam2
Command parameter 3	EIPOutput.CommandParam3

Response Area

Signal name	Variable name
FLG	EIPInput.StatusFlag.F[0]
BUSY	EIPInput.StatusFlag.F[1]
OR	EIPInput.StatusFlag.F[3]
RUN	EIPInput.StatusFlag.F[4]
ACK	EIPInput.StatusFlag.F[6]

Signal name	Variable name
XFLG	EIPInput.StatusFlag.F[8]
XBUSY	EIPInput.StatusFlag.F[9]
XWAIT	EIPInput.StatusFlag.F[10]
ERR	EIPInput.StatusFlag.F[15]
GATE	EIPInput.StatusFlag.F[16]
Command Code	EIPInput.CommandCodeEcho
Response Code	EIPInput.ResposeCode
Response Data	EIPInput.ResposeData

#### Output area

Signal name	Variable name
Output data 1	EIPInput.OutputData[0]
· ·	
Output data 8	EIPInput.OutputData[7]

### • Specify the I/O memory addresses to access each communication area

By setting AT specifications to variables, assigned destination to each communication area can be specified in the unit of the I/O memory address.

### **1** Setting the tag sets (by Network Configurator)

Directly specify the tag names in the PLC by using the I/O memory addresses that each communication area is assigned to. (The output tags are specified for the input connections to the Sensor Controller and the input tags are specified for the output connections to the PLC.)

#### Setting example

Tag kind	Assigned I/O memory address
Output tag	D0
Input tag	D100

### **2** Setting Variables (by Sysmac Studio)

Define variables with AT (assigned destination) specifications to the I/O memory addresses assigned to each communication area as shown below.

#### Setting example

Variable	AT specification
а	D0.0
b	D0.1
С	D0.15
d	D1.0

### **3** Setting Connections

Configure the connections as shown below.

Originator device (PLC) settings	Target device (Sensor Controller) settings
Input tag set: D0	Output tag set: Input101

### 2-3-13 I/O Signals

The following tables list the signals used to control I/O for EtherNet/IP.

### Input Signals

		E satis	ON/OFI	F timing
Signal	Signal name	Function	OFF to ON	ON to OFF
EXE	Command Re- quest Signal	The user (PLC) turns this signal ON when is- suing a command to the Sensor Controller.	The user (PLC) turns this signal ON when is- suing a command (in- struct the execution) to the Sensor Controller based on the command code and command pa- rameters.	The user (PLC) switches this signal from ON to OFF when the Sensor Controller turns the Command Completion (FLG) sig- nal ON. <sup>*1</sup>
DSA (Used only for handshaking output control)	Data Output Request Signal	During handshaking, the user (PLC) issues this signal to the Sensor Controller to request to output externally the measured results per- formed in the measure- ment flow. When this signal is ON while an Output Unit (Fieldbus Data Output Unit) in the measure- ment flow is performed, the Sensor Controller outputs the data of the processing item.	<ul> <li>The user (PLC) turns this signal ON when requesting the measurement data to output externally.*3</li> <li>This DSA signal is turned ON at the same time as the Trigger (STEP) or Command Request (EXE) signal switches from OFF to ON. When more than one Output Units is used to output units is used to output more than eight data, turn ON this DSA signal again after the GATE signal for the first data output turns OFF. For details, refer to2-3-18 Timing Chart on page 2-249.</li> </ul>	The user (PLC) switches this signal from ON to OFF when the Sensor Controller turns the GATE signal ON.*2
ERCLR	Error Clear Bit	This is turned ON when the Error (ERR) signal from the Sensor Con- troller will be cleared.	The user (PLC) switches the signal from OFF to ON when the Error (ERR) signal from the Sensor Controller is turned OFF.	This signal is turned OFF when the user (PLC) detected the Er- ror (ERR) signal turned OFF.

Signal	Cignal name	Function	ON/OFF timing	
Signal	Signal name	Function	OFF to ON	ON to OFF
XEXE	Flow Com- mand Request	This is turned on when a command will be per- formed while PLC Link, Fieldbus, or parallel flow control are per- formed.	The user (PLC) switches the signal from OFF to ON when it in- structs an entered com- mand execution during the execution of the Fieldbus flow control.	This signal switches from ON to OFF when the Flow Command Completion (XFLG) sig- nal is turned ON.
STEP	Measurement Trigger	This is turned on when measurements will be performed.	This signal turns ON from the PLC) to per- form measurement after confirming that the BUSY signal and the Command Execution Completion (FLG) sig- nal have turned OFF.	The user (PLC) switches this signal from ON to OFF after detecting that the Sen- sor Controller turned the BUSY signal ON.

\*1. If the Command Request (EXE) signal does not switch from ON to OFF within 10 seconds after the Command Completion (FLG) signal was turned ON, a timeout error will occur, and the FLG signal is forced to be turned OFF.

\*2. If the Data Output Request (DSA) signal does not switch from OFF to ON within the time set at the "Timeout" in the EtherNet/IP settings after the Data Output Completion (GATE) signal turned ON, a timeout error will occur and the measurement data prepared for output will be discarded.

\*3. If the Data Output Request (DSA) signal does not switch from OFF to ON within the time set at the "Timeout" in the EtherNet/IP settings after the measurement processing started by the Measurement Trigger (STEP) signal or the Command Request (EXE) signal turned ON, a timeout error will occur and the measurement data prepared for output will be discarded.

### **Output Signals**

Signal	Signal Signal name E		ON/OFF timing		
Signal	Signal name	Function	OFF to ON	ON to OFF	
BUSY	Busy	This signal indicates that external inputs such as commands cannot be accepted. Is- sue a command when this signal is OFF. *1*2*3	This signal turns ON when the Sensor Con- troller receives a com- mand from the user (PLC). (After the EXE signal switches from OFF to ON.)	The signal turns OFF when the command ex- ecution is completed.	
FLG	Command Ex- ecution Com- pletion	The Sensor Controller uses this signal to in- form the PLC that com- mand execution has been completed.	The signal turns ON when the Sensor Con- troller completes execu- tion of a received com- mand.	This signal is turned OFF when the user (PLC) switches the Command Request (EXE) signal from ON to OFF.	

0.1	Signal Signal name Eurotion			ON/OFF timing		
Signal	Signal name	Function	OFF to ON	ON to OFF		
GATE	Data Output Completion Signal	The signal informs the PLC of the timing to load output data. "ON" of this signal indi- cates that the Sensor Controller is outputting the data. The user (PLC) starts to load the data when the signal turns ON.	<ul> <li>Without handshaking The signal turns ON when the Sensor Controller performs the Output Unit (Fieldbus Data Out- put Unit)<sup>*4</sup> in the measurement flow and is ready for the data output.</li> <li>With handshaking The signal turns ON when the Sensor Controller performs the Output Unit (Fieldbus Data Out- put Unit)<sup>*4</sup> in the measurement flow and is ready for the data output and the Data Output Request (DSA) signal is ON.</li> </ul>	<ul> <li>Without handshaking The signal turns OFF after the <i>Output Time</i> set in the EtherNet/IP settings has passed.</li> <li>With handshaking This signal is turned OFF when the user (PLC) switches the Data Output Request (DSA) signal from ON to OFF.</li> </ul>		
ERR	Error Signal	The signal indicates that the Sensor Control- ler detects the following errors. For details of the errors, refer to <i>Error Messages</i> <i>and Troubleshooting</i> in the Vision System FH/FHV Series User's Manual (Cat. No. Z365)	The signal turns ON if the Sensor Controller detects an error.	The signal turns OFF when the error is fixed and the user (PLC) turns the Error Clear (ERCLR) signal ON.		
RUN	Run Mode	The signal indicates that the Sensor Control- ler in RUN Mode.	The signal turns ON when the Sensor Con- troller is in Run Mode.	The signal turns OFF when the Sensor Con- troller is in Adjustment Mode.		
OR	Overall judg- ment	The signal indicates the overall judgment re- sults.	The signal turns ON when the overall judg- ment is NG.	The signal turns OFF when the overall judg- ment is OK.		
ACK	Command Re- ception	The signal indicates that a command is re- ceived. Even BUSY is not output due to a heavy load, it surely de- tects the completion of the command process- ing execution.	The signal is turned ON when Measure Bit (STEP) or Command Execution Bit (EXE) is received.	The signal switches from ON to OFF after the execution complet- ed and either the STEP Bit or EXE Bit is OFF.		

Signal	Signal Signal name Function		ON/OFF timing		
Signal	Signal name	Function	OFF to ON	ON to OFF	
XFLG	Flow Com- mand Execu- tion Comple- tion	The signal indicates that a command per- formed during execu- tion of the Fieldbus flow control has been com- pleted.	The signal is turned ON when a command per- formed has been com- pleted (XBUSY switch- ed from ON to OFF) during execution of Fieldbus flow control.	The signal switches from ON to OFF when the Flow Command Busy (XBUSY) signal switches form OFF to ON during the execu- tion for the Fieldbus flow control.	
XBUSY	Flow Com- mand Busy Bit	The signal indicates that a command en- tered during the execu- tion of the Fieldbus flow control is in execution.	The signal switches from OFF to ON when a command entered dur- ing the execution for the Fieldbus flow control is in execution.	The signal switches from ON to OFF when a command execution en- tered during the execu- tion of the Fieldbus flow control has been com- pleted.	
XWAIT	Flow Com- mand Wait Bit	The signal indicates that a command en- tered can be accepted during the execution of the Fieldbus flow con- trol.	The signal switches from OFF to ON when a command can be input during the execution of the Fieldbus flow con- trol.	This signal switches from ON to OFF when a command cannot be entered during the exe- cution of the Fieldbus flow control.	

\*1. Although the BUSY signal remains ON during continuous measurement, the Sensor Controller accepts the Command Request (EXE) signal only when the End Continuous Measurement command is performed.

\*2. This will not be detected while commands received through any other protocol are processed. (Ex.: This signal remains OFF during measurement with the STEP signal in the Parallel communications.) If you use more than one protocol and need to detect command execution, use the BUSY signal in Parallel communications.

\*3. "ON" of this signal does not mean that a command is currently performed. To check whether a command is being executed, refer to the Command Execution Completion (FLG) signal.

\*4. This occurs when the measurement flow is performed in order from the top and the Output Unit is executed, not at the moment when measurement execution was completed.

### 2-3-14 Output Items

## Measurement Results for which Output is Possible (Fieldbus Data Output)

The following data can be output using the processing items related to the Result Output. Measurement values are also referred using processing units such as expressions.

Measurement items	Character string	Description
Judgment	JG	Judgment result
Data 0 to 7	D000 to D007	Results of expressions set for output data 0 to 7.

### **External Reference Tables (Fieldbus Data Output)**

By specifying a number, the following data can be referred using control commands or processing items having a set/get processing unit data function.

Number	Data name	Set/Get	Data range
0	Judgment	Get only	0: No judgment (unmeasured) 1: Judgment result OK -1: Judgment result NG
5 to 12	Data 0 to 7	Get only	<ul> <li>ASCII:-9999999999999999 to 999999999999999</li> <li>Binary: -2147483.648 to 2147483.647</li> </ul>
150	Output type	Set/Get	0: Fixed point 1: Floating point

### 2-3-15 Command List

This section describes the commands used in EtherNet/IP.

A command with command words in the Command Area first channel can be performed in both tag data link and message communications.

A command without command words in the Command Area first channel can be performed only in message communications.

For details of commands in tag data link, refer to A-1-4 Command Details for PLC Link, EtherNet/IP, EtherCAT, and PROFINET on page A-15.

### • Execution Commands

First word in Response Area		Function	Reference
+3	+2		
0010	1010	Performs measurement one time.	page A-15
0010	1020	Performs continuous measurement.	page A-15
0010	1030	Ends continuous measurements.	page A-16
0010	1040	Performs test measurement for the specified unit.	page A-16
0010	2010	Clears all measurement result values.	page A-17
0010	2020	Clears the data output buffer.	page A-18
0010	3010	Saves the current system data and scene group data in the Sensor Controller.	page A-19
0010	4010	Registers the model again.	page A-20
0010	5010	Shifts the image display position by the specified amount.	page A-21
0010	5020	Zooms the image display in or out by the specified factor.	page A-21
0010	5030	Returns the display position and display magnification to their default values.	page A-22
0010	7010	Copies the scene data.	page A-24
0010	7020	Deletes the scene data.	page A-25
0010	7030	Moves the scene data.	page A-25
-	-	Registers the specified image data as a registered image.	page A-26
0010	8020	Loads the specified registered image as the measurement image.	page A-27
0010	9010	Returns an entered text string without changing it.	page A-27
-	-	Adds a user account to a specified group ID.	page A-28
-	-	Deletes a specified user account.	page A-29
0010	B010	Branches to the start of the measurement flow (processing unit 0).	page A-30
0010	F010	Restarts the Sensor Controller.	page A-30

2-3-15 Command List

### • Commands to Get Status

First word in Response Area		Function	Reference
+3	+2		
0020	1000	Gets the current scene number.	page A-31
0020	2000	Gets the current scene group number.	page A-31
0020	4000	Gets the number of the layout that is currently displayed.	page A-32
0020	5010	Gets the number of the Unit that is currently displayed in the specified image display window.	page A-33
0020	5020	Gets the sub-image number that is currently displayed in the specified image display window.	page A-33
0020	5030	Gets the image mode for the specified image display win- dow.	page A-35
0020	7010	Gets the input status (prohibited/permitted) for the Commu- nications Modules.	page A-35
0020	7020	Gets the output status (prohibited/permitted) to an external device.	page A-36
0020	8010	Gets the ON/OFF status for the specified parallel I/O termi- nal.	page A-38
0020	8020	Gets the ON/OFF status of all parallel terminals except for DI terminals.	page A-40
0020	8030	Gets the ON/OFF status of all parallel DI terminals.	page A-42
-	-	Gets the user name for the user account currently logged in.	page A-43
-	-	Gets the group ID for the account currently logged in.	page A-45
0020	A000	Gets the current state of the operation log.	page A-45

### • Commands to Set Status

First word in Response Area		Function	Reference
+3	+2		
0030	1000	Switches to the specified scene number.	page A-46
0030	2000	Switches to the scene group with the specified number.	page A-46
0030	4000	Sets the layout number and switches the image.	page A-48
0030	5010	Sets the number of the Unit to display in the specified im- age display window.	page A-49
0030	5020	Sets the number of the sub-image to display in the specified image display window.	page A-49
0030	5030	Sets the image mode for the specified image display win- dow.	page A-50
0030	7010	Permits/prohibits inputs to the Communications Modules.	page A-51
0030	7020	Permits/prohibits outputs to external devices.	page A-52
0030	8010	Sets the ON/OFF status of the specified parallel I/O termi- nal.	page A-52
0030	8020	Sets the ON/OFF status of all parallel terminals except for DO terminals.	page A-55

First word in Response Area		Function	Reference
+3	+2		
0030	8030	Sets the ON/OFF status of all parallel DO terminals.	page A-57
-	-	Switches the currently logged in account.	page A-58
0030	A000	Sets the state of the operation log.	page A-60

### • Commands to Read Data

First word in Response Area		Function	Reference
+3	+2		
0040	1000	Gets the specified processing unit data.	page A-60
-	-	Gets the date and time.	page A-61
-	-	Gets the Sensor Controller version information.	page A-62
-	-	Gets settings related to image logging.	page A-62
-	-	Gets the image logging folder name.	page A-64
-	-	Gets the data logging folder name.	page A-65
-	-	Gets the screen capture folder name.	page A-66
-	-	Gets the prefix for the file name in which logged images are saved.	page A-66
0040	4050	Gets the conditions set for data logging.	page A-67
0040	4060	Gets the parallel DI terminal offset data that is set.	page A-67

### • Commands to Write Data

First word in Response Area		Function	Reference	
+3	+2			
0050	1000	Sets the specified unit data.	page A-68	
-	-	Sets the date and time.	page A-69	
-	-	Changes the settings related to image logging.	page A-70	
-	-	Sets the name for the image logging folder.	page A-71	
-	-	Sets the name for the data logging folder.	page A-72	
-	-	Sets the name for the screen capture folder.	page A-72	
-	-	Sets the prefix for the file name in which logged images are saved.	page A-73	
0050	4050	Sets the data logging conditions.	page A-73	
0050	4060	Sets the parallel DI terminal offset data.	page A-75	

### • File Load Commands

First word in Response Area		Function	Reference	
+3	+2			
-	-	Loads the scene data.	page A-76	
-	-	Loads the scene group data.	page A-76	
-	-	Loads the system data.	page A-77	
-	-	Loads the system + scene group 0 data.	page A-78	

### • File Save Commands

First word in Response Area		Function	Reference	
+3	+2			
-	-	Saves the scene data.	(p.578)	
-	-	Saves the scene group data.	(p.580)	
-	-	Saves the system data.	(p.586)	
-	-	Saves the image data stored in the the Sensor Controller's memory.	(p.539)	
-	-	Saves all image data in the Sensor Controller's memory with ifz format in external storage. (p.502)		
-	-	Saves the last logging image. (p.543)		
-	-	Saves the system + scene group 0 data that is currently used by the Sensor Controller in a file. (p.504)		
-	-	Captures the screen. (p.520)		

### 2-3-16 Command Response Processing

About control command response processing, the following timing chart describes the ON/OFF timing of signals related to commands to be input.

### • Timing Chart for Command Execution

The Command Request (EXE) signal is used as the trigger to input and execute various commands such as measurement execution stored in advance in the PLC memory.

The Command Completion (FLG) signal turns ON when execution of the control command is completed. Use this as the trigger to turn OFF the Command Request (EXE) signal.

\*1: A timeout error will occur if you do not turn off the Command Execution (EXE) signal within 10 seconds after the Command Completion (FLG) signal is turned ON. Command Completion (FLG) signal and BUSY signal will be forcefully turned OFF.

- \*2: Busy (BUSY) signal is automatically switched ON to OFF when the command execution is completed.
- (1) The PLC sets the command code and command parameters.
- (2) After checking that the BUSY signal and the Command Completion (FLG) signal have turned OFF, the PLC turns ON the Command Request (EXE) signal again to instruct the Sensor Controller to perform it.
- (3) When receiving the instruction the Sensor Controller performs the command and turns ON the ACK signal and the BUSY signal.
- (4) When completing the execution, the Sensor Controller sets the command code, response code, and response data.

The Command Completion (FLG) signal is turned ON.

(5) The PLC (user) turns OFF the Command Request (EXE) signal when the Command Completion (FLG) signal turns ON.

(6) When detecting that the Command Request (EXE) signal is OFF, the Sensor Controller automatically turns OFF the Command Reception (ACK) signal and the Command Completion (FLG) signal automatically.

### Continuous Measurement Command (Without handshaking)

Continuous execution is used to repeatedly execute measurement by starting the next measurement operation (image input and measurement processing) as soon as single measurement operation (image input and measurement processing) is completed.

Continuous measurement is started when the Start Continuous Measurements command is executed and ended when the End Continuous Measurements command is executed.

- \*1: A timeout error will occur if you do not turn off the Command Execution (EXE) signal within 10 seconds after the Command Completion (FLG) signal is turned ON.
- Command Completion (FLG) signal and BUSY signal will be forcefully turned OFF.
- \*2: Busy (BUSY) signal is automatically switched ON to OFF when the command execution is completed.

#### <Operation to Start Continuous Measurement>

- (1) The PLC (user) sets the Start Continuous Measurements command code.
- (2) After checking that the BUSY signal and the Command Completion (FLG) signal have turned OFF, the PLC turns ON the Command Request (EXE) signal again to instruct the Sensor Controller to perform it.
- (3) When completing the preparations for continuous measurement, the Sensor Controller sets the command code and response code. when preparations for continuous measurement have been completed.
- (4) The Command Completion (FLG) signal is turned ON.

- (5) The PLC (user) turns OFF the Command Request (EXE) signal when the Command Completion (FLG) signal turns ON.
- (6) After detecting that the Command Request (EXE) signal has turned OFF, the Sensor Controller starts continuous measureent and turns ON the Command Reception (ACK) signal and the BUSY signal.
- (7) The Command Completion (FLG) signal is automatically turned OFF.

#### <Operation to End Continuous Measurement>

- (8) The PLC (user) sets the End Continuous Measurements command code during execution of continuous measurement by the Start Continuous Measurements command.
- (9) The Command Request (EXE) signal is then turned ON and the instruction is sent to the Sensor Controller.

### Additional Information

Continuous measurement is not ended in the middle of measurement. When the End Continuous Measurements command was executed, continuous measurement is ended after the measurement in execution was completed.

#### <Ending Continuous Measurement>

- (10) When receiving the instruction, the Sensor Controller stops continuous measurement and turns OFF the BUSY signal.
- (11) After setting the command code and response code, the Sensor Controller turns ON the Command Completion (FLG) signal.
- (12) When detecting that the Command Completion (FLG) signal turns ON, the PLC (user) turns OFF the Command Request (EXE) signal.
- (13) After detecting that the Command Request (EXE) signal has turned OFF, the Sensor Controller automatically turns OFF the Command Reception (ACK) signal and Command Completion (FLG) signal automatically.

### rh

### Precautions for Correct Use

- The measurement during continuous measurement is given priority. Therefore, display of the measurement results (total judgment, images, judgment for each processing unit in the flow display, and detailed results) may sometimes not be updated.
- When continuous measurement is ended, the measurement results from the last measurement will be displayed.

### • Performing Measurement wit the STEP Signal

In addition to inputting and executing the Command Request (EXE) as a trigger, the Measurement Trigger Execute (STEP) signal can be used to perform measurement.

- (1) While the ACK signal is OFF, measurement starts by the rising edge of the Measurement Trigger Execute (STEP) signal.
- (2) The starting measurement turns ON the ACK signal.
- (3) The Measurement Trigger Execute (STEP) signal is turned OFF when the ACK signal turns ON.
- (4) The Overall Judgement (OR) signal is output when measurement is completed.
- (5) The ACK signal is turned OFF when the measurement flow is completed.
- (6) When the measurement flow ends and the measurement execution bit (STEP) is OFF, the processing acceptance (ACK) signal turns OFF.

### 2-3-17 Data Output

This section describes the ON/OFF timing for signals related to measurement data output after measurement completion using the following timing chart.

### • Without handshaking

<sup>\*1, \*2:</sup> Data is output at the set output period  $^{\ast 1}$  and for the set output time.  $^{\ast 2}$ 

After the data is output, the GATE signal is turned ON and the data is held for the data output time.

- (1) The Sensor Controller outputs data when the Fieldbus Data Output Unit starts execution.
- (2) Data is output each time that the Fieldbus Data Output Unit is performed for the second time or other Fieldbus Data Output Unit is performed. In that time, the output data for the first time is overwritten.

### **Precautions for Correct Use**

- To receive all the output data, set [Output control] to [Handshaking], and then output data. For details, refer to *Setting the EtherNet/IP Output Specifications* on page 2-202, and *Output Format (Fieldbus Data Output)* on page 2-215.
- If any part of data is missing on the PLC side, or the GATE signal is not output from the FH Sensor Controller, set *Measurement priority* to *Lower the priority of the measurement process*. Note that the measurement time becomes longer with this setting. For details, refer to Setting the Status at Startup *Startup Settings* in the *Vision System FH/FHV Series User's Manual (Cat. No. Z365)*

### With handshaking

The Result Completion (GATE) signal switches from OFF to ON when the PLC (user) switches the Result Set Request (DSA) signal from OFF to ON.

At that time, data that is possible to output will be output.\*1

The PLC (user) switches the DSA signal from ON to OFF under the conditions whether it has received the output data and the Result Completion (GATE) signal has been turned ON. In the case where multiple Fieldbus Data Output Units perform the data output, the PLC (user) turns the Data Output Request (DSA) signal ON again to instruct it to output the following data, when the Sensor Controller switched the Data Output Completion (GATE) signal from ON to OFF.

\*1: Data prepared for output which an Output Unit has been already performed in the measurement flow.

\*1 A timeout error will occur if any of the following states continues for longer than the timeout time that is set in the EtherNet/IP settings.
 • If the DSA signal is not turned ON after a certain time elapses from when the Output Unit was executed. (Turn ON the DSA signal at the same time as the measurement trigger command.)

. If the DSA signal is not turned OFF after a certain time elapses from when the GATE signal turns ON.

- (1) The PLC (user) turns ON the Command Request (EXE) signal and the Data Output Request (DSA) signal at the same time. The output data for the first Fieldbus Data Output Unit can be surely received.
- (2) The Sensor Controller performs the Fieldbus Data Output Unit in the measurement flow. Since the Data Output Request (DSA) signal is ON after the data is written, the Data Output Completion (GATE) signal becomes ON.
- (3) The PLC (user) reads the data when the Result Completion (GATE) signal turns ON and it turns OFF the Result Set Request (DSA) signal.
- (4) The Sensor Controller automatically turns OFF the Result Completion (GATE) signal when it detects that the Result Set Request (DSA) signal has turned OFF.
- (5) If there is more than one Fieldbus Data Output Unit in the measurement flow, the PLC (user) turns ON the Data Output Request (DSA) signal when the Data Output Completion (GATE) signal turns OFF, and then it waits for execution of the next Fieldbus Data Output Unit.
- (6) When the next Fieldbus Data Output Unit is executed, the GATE signal turns ON and the data is output. Receive the second output data and then repeat steps 3 to 5, above. Repeat steps 3 to 5 for any other data outputs.

2-3-18 Timing Chart

### 2-3-18 Timing Chart

This section describes the ON/OFF timing for signals related to the sequence of operation from control command input until measurement data output after measurement completion using the following timing chart.

### • Example 1: Inputting a Measurement Trigger after Switching a Scene without Handshaking

\*1: A timeout error will occur if you do not turn off the Command Execution (EXE) signal from Sensor Controller (master) within 10 seconds. Then Command Completion (FLG) signal and Busy (BUSY) signal will be forced to turn off.

\*2: Busy (BUSY) signal is automatically switched ON to OFF when the command execution is completed.

- (1) The PLC sets the command code and command parameters for the Switch Scene.
- (2) Next, confirm that the BUSY signal and the Command Completion (FLG) signal have turned OFF and then turn ON the Command Request (EXE) signal. A request is sent to the Sensor Controller.
- (3) The Sensor Controller turns ON the Command Reception (ACK) signal and BUSY signal and switches the scene when the request is received.
- (4) The Command Completion (FLG) signal is turned ON when the scene switching is completed.
- (5) The PLC (user) turns the Command Request (EXE) signal OFF when the Command Completion (FLG) signal is switched from OFF to ON.
- (6) After detecting that the Command Request (EXE) signal has turned OFF, the Sensor Controller automatically turns OFF the Command Reception (ACK) signal and Command Completion (FLG) signal.
- (7) The measurement command code and command parameters are set from the PLC.
- (8) The Command Request (EXE) signal is turned ON to execute the measurement command.

#### **Additional Information**

To execute a measurement trigger after changing the scene, first confirm that the Command Completion (FLG) signal and the BUSY signal that turned ON for execution of the Select Scene command have turned OFF.

Also, if the BUSY signal is ON for too little time and the external device cannot read it, increase the time that the BUSY signal is ON for changing scenes so that the external device can read the ON state. To do this, change the *Add time* setting for the *Scene switch time*. Refer to *Setting the Conditions That Are Related to Operation during Measurement* in the *Vision System FH/FHV Series User's Manual (Cat. No. Z365)*.

- (9) The Sensor Controller turns ON the Command Reception (ACK) signal and BUSY signal and performs measurement processing when the request is received.
- (10) The Command Completion (FLG) signal is turned ON when the measurement processing was completed.
- (11) The PLC (user) turns the Command Request (EXE) signal OFF when the Command Completion (FLG) signal turns ON.
- (12) When the Sensor Controller detects that the Command Request (EXE) signal is OFF, it automatically turns OFF the Command Reception (ACK) signal and Command Execution Completion (FLG) signal.

## • Example 2: Outputting Data with more than One Output Unit Without Handshaking

\*1: A timeout error will occur if you do not turn off the Command Execution (EXE) signal from Sensor Controller (master) within 10 seconds. Then Command Completion (FLG) signal and Busy (BUSY) signal will be forced to turn off.

\*2: Busy (BUSY) signal is automatically switched ON to OFF when the command execution is completed.

- (1) The measurement command code and command parameters are set from the PLC.
- (2) Next, confirm that the BUSY signal and the Command Completion (FLG) signal have turned OFF and then turn ON the Command Request (EXE) signal. A request is sent to the Sensor Controller.
- (3) The Sensor Controller turns ON the BUSY signal and executes measurement processing when the request is received.
- (4) When the first Fieldbus Data Output Unit in the measurement flow is executed, the Sensor Controller outputs data for the first Fieldbus Data Output Unit to the Data Output Area.

- (5) The Sensor Controller turns the Data Output Completion (GATE) signal ON when the data is output to the Data Output Area.
- (6) The Sensor Controller turns the Data Output Completion (GATE) signal OFF after the time set at the **Output time** in the EtherNet/IP settings has passed.
- (7) The second Fieldbus Data Output Unit in the measurement flow is executed.
- (8) The Sensor Controller outputs the data for the second Fieldbus Data Output Unit to the Data Output Area after the time set at the **Output period** in the EtherNet/IP settings has passed. At that time, the data for the first Fieldbus Data Output Unit is overwritten.
- (9) The Sensor Controller turns the Data Output Completion (GATE) signal OFF after the time set at the **Output time** in the EtherNet/IP settings has passed.
- (10) The Command Completion (FLG) signal is turned ON when the measurement processing was completed.
- (11) The PLC (user) turns the Command Request (EXE) signal OFF when the Command Completion (FLG) signal turns ON.
- (12) When the Sensor Controller detects that the Command Request (EXE) signal is OFF, it automatically turns OFF the Command Reception (ACK) signal and Command Execution Completion (FLG) signal.

### **Additional Information**

#### Saving All of the Measurement Results

If you output data from more than one Data Output Unit or for repeatedly measured output data (e.g., for continuous measurement), the same Data Output Area will be overwritten.

To save all of the output data, adjust the *output period* and *output time* that are set in the Ether-Net/IP settings so that all of the output data is output and either receive all of the output data by using the Result Completion (GATE) signal or use handshaking control.

Handshaking lets you control data output by using the GATE signal turning ON as a trigger for the data output timing and turning ON the DSA to read the output data. (This is necessary from the second output data item onward.)

Each time that data is output (from the second output on), read the output data and move it to a different part of I/O memory in the PLC.

For details of handshaking, Refer to *Data Output Control with Handshaking* on page 1-25. You can compare the received number of output data and the number of measurements for continuous measurements to check if all of the measurement results have been received. Use the following method to check the number of measurements that was actually executed.

- Application Example
  - Set a calculation to count the number of measurements that are executed in the measurement flow.

If you set something like [DO+1], each time a measurement is executed (each time the measurement flow is executed), 1 will be added to DO, so the present value of DO will give you the actual number of measurements.

### 2-3-19 Communicating with the Sensor Controller using EtherNet/IP Message Communications

Message communications are used to communicate with a PLC that does not support tag data link communications or to use functions such as character string output that are not supported by tag data link.

There are two ways in message communications: one way uses Assembly Object to exchange the same data as for tag data link communications, and another way uses Vision Sensor Object specific for the Sensor Controller to send and receive commands equivalent to non-procedure commands. This document mainly describes the Vision Sensor Object specific for the Sensor Controller and Assembly Object. For the procedures to issue messages, refer to your PLC's manual.

### **Object Configuration**

EtherNet/IP functions of the Sensor Controller have the following objects. These objects can be accessed using message communications.

Class (Ob- ject name)	Class ID	Instance ID		
Identity Ob- ject	1 (01 Hex)	1 (01 Hex)		
Message Router Object	2 (02 Hex)	1 (01 Hex)		
Assembly Ob- ject	4 (04 Hex)	100 (64 Hex): Output connection (for normal control and for line 0 in Multi-line Random-trigger Mode)		
		101 (65 Hex): Input connection in Multi-line Random-trigger Mode)		
		102 (66 Hex): Output connection (for normal control and for line 0 in Multi-line Random-trigger Mode)		
		103 (67 Hex): Input connection in Multi-line Random-trigger Mode)		
Connection Manager Ob- ject	6 (06 Hex)	1 (01 Hex)		
Vision Sensor	100 (64 Hex)	1 (01 Hex): For normal control and for line 0 in Multi-line Random-trigger Mode		
Object		2 (02 Hex): For line 1 in Multi-line Random-trigger Mode		
		3 (03 Hex): For line 2 in Multi-line Random-trigger Mode		
		4 (04 Hex): For line 3 in Multi-line Random-trigger Mode		
		5 (05 Hex): For line 4 in Multi-line Random-trigger Mode		
		6 (06 Hex): For line 5 in Multi-line Random-trigger Mode		
		7 (07 Hex): For line 6 in Multi-line Random-trigger Mode		
		8 (08 Hex): For line 7 in Multi-line Random-trigger Mode		
TCP/IP Inter- face Object	245 (F5 Hex)	1 (01 Hex)		
EtherNet Link Object	246 (F6 Hex)	1 (01 Hex)		

#### **Data Types**

The data types are predetermined in the EtherNet/IP specifications as shown below.

Dete ture	Description	Ra	nge
Data type	Description	Min. value	Max. value
BOOL	Boolean	0: FALSE	1: TRUE
SINT	Short integer	-128	127
INT	Integer	-32768	32767
DINT	Double-precision integer	-2 <sup>31</sup>	2 <sup>31</sup> - 1
USINT	Unsigned short integer	0	255
UINT	Unsigned integer	0	65535
UDINT	Unsigned double-precision integer	0	2 <sup>32</sup> - 1
BYTE	Bit string: 8 bits	-	-
WORD	Bit string: 16 bits	-	-
DWORD	Bit string: 32 bits	-	-
REAL	Floating-point real	Single-precision floating-point range	

### Class ID: 4 Assembly Object

This object is used to communicate with a PLC that does not support tag data link communications.

#### Settings for Data Received by the Sensor Controller

#### Instance

Setting item	Setting value	Description		
	100	For normal control and for line 0 in Multi-line Random-trigger Mode		
	102	For line 1 in Multi-line Random-trigger Mode		
	104	For line 2 in Multi-line Random-trigger Mode		
Instance	106	For line 3 in Multi-line Random-trigger Mode		
Instance	108	For line 4 in Multi-line Random-trigger Mode		
	110	For line 5 in Multi-line Random-trigger Mode		
	112	For line 6 in Multi-line Random-trigger Mode		
	114	For line 7 in Multi-line Random-trigger Mode		

#### Attribute

Attribute ID	Access	Name	Data type	Description
0x03	Set	Data	BYTE ar- ray	This sets the command received by the Sensor Controller. The format is the same as an output connection in tag data link communications. For details, refer to <i>Input Connection</i> <i>to the Sensor Controller (PLC (Originator) to Sensor</i> <i>Controller (Target)) on page 2-224</i> .
0x04	Get	Size	UNIT Number of bytes: 20	

#### Service

Service code	Name	Description
14 (0E Hex)	GetAttributeSingle	This attribute gets the attribute value.
16 (10 Hex)	SetAttributeSingle	This attribute sets a value for the attribute. Whether an attribute can be set depends on the access attribute of it.

### Settings for Data Sent by the Sensor Controller

#### Instance

Setting item	Setting val- ue	Description		
	101	For normal control and for line 0 in Multi-line Random-trigger Mode		
	103	For line 1 in Multi-line Random-trigger Mode		
	105	For line 2 in Multi-line Random-trigger Mode		
Instance	107	For line 3 in Multi-line Random-trigger Mode		
Instance	109	For line 4 in Multi-line Random-trigger Mode		
	111	For line 5 in Multi-line Random-trigger Mode		
	113	For line 6 in Multi-line Random-trigger Mode		
	115	For line 7 in Multi-line Random-trigger Mode		

#### Attribute

Attribute ID	Access	Name	Data type	Description
0x03	Get	Data	BYTE array	This attribute sets the data sent by the Sen- sor Controller The format is the same as an input connec- tion in tag data link communications. For details, refer to <i>Output Connection to PLC</i> <i>(Sensor Controller (Originator) to PLC</i> <i>(Target)) on page 2-225.</i>
0x04	Get	Size	UNIT	Number of bytes: 48

#### Service

Service code	Name	Description
14 (0E Hex)	GetAttributeSingle	This attribute gets the attribute value.

2-3-20 Example for Command Settings

### Class ID:100 (64 Hex) Vision Sensor Object

These objects are specific for the Sensor Controller and can exchange character string data with a format equivalent to commands for the non-procedure protocol. Character strings that are not supported in tag data link can be output.

#### Instance

Setting item	Setting value	Description		
Instance	1	For normal control and for line 0 in Multi-line Random-trigger Mode		
Instance	2 to 8	For lines 1 to 7 in Multi-line Random-trigger Mode		

#### Attribute

Attribute ID	Access	Name	Data type	Description
0x01	Set	Data	BYTE array	This sets the command string sent to the Sensor Controller. (Max. 504 characters) The commands that can be used are equivalent to commands for the Non-procedure protocol. For details, refer to <i>A-1-3 Command</i> <i>List on page A-7</i> .

#### Service

Service code	Name	Description	
50 (32 Hex)	SetAttribute	Sets a value for the attribute.	

### 2-3-20 Example for Command Settings

This section describes how to set command strings for Attribute and provides a setting example.

- As the data transmitted from the PLC to the Sensor Controller, set a command string equivalent to a command for the non-procedure protocol. Add NULL (0x00) at the end of the string. No line feed code is required. The size of the transmitted data includes the NULL (0x00) at the end of the string.
- As the data received by the PLC from the Sensor Controller, return string data equivalent to the received string of a command for the non-procedure protocol. NULL (0xll) is inserted into the delimiter part in the received string. The size of the received data includes the NULL (0x00) at the end of the string.

Examle: When getting the number (0) of the currently used scene: (Transmitted data: 2 bytes) 0x53 ('S') 0x00

(Received data: 5 bytes) 0x30('0') 0x00 0x4f('O') 0x4b('K') 0x00

#### **Additional Information**

- To acquire data output from a processing unit, such as characters read in Character Inspection, use the external reference data for the processing unit.
   Therefore, use the specified command which acquires the parameters or measurement value.
- For details, refer to UNITDATA or UD on page A-169.
- For the external reference No. which is used in UNITDATA or UD function, refer to the description of each processing items.

### 2-3-21 EtherNet/IP Troubleshooting

### **Cannot Input to the Sensor Controller**

	processing, communications be-	
	tween an external device and the	
	Sensor Controller may be tempora-	
	rily interrupted and a communica-	
	tion error may occur.	

### **Slow Operation**

Problem	Cause	Action	
Response and data output is slow.	You try to use a wrong combination for communication protocols such as PLC Link and EtherNet/IP.	Use a proper combination of com- munication protocols.	

### Settings are not kept

Problem	Cause	Action
Settings such as Fieldbus Data	Changed the communication set-	Set the Fieldbus Data Output after
Output calculations and comments	tings after setting the Fieldbus Data	performing the communication set-
are not kept.	Output	tings.

# Communications between the Sensor Controller and external devices are not correctly done.

Problem	Cause	Action
The Sensor Controller cannot com- municate with an external device such as a PLC properly. (Only for Ethernet)	The communication settings such as IP address have been changed after the Device information storage tool was performed. (The IP ad- dresses for external devices on the network may have overlapped the IP addresses stored in the Sensor Controller.)	Check that the communication set- tings such as IP address are cor- rect. ( <b>Tool</b> menu - <b>System setting</b> - <b>Communication - Ethernet</b> ) Per- form the Device information storage tool again. The communication set- tings in the software will be copied in the Sensor Controller.

### **Missing of data Occurs**

Problem	Cause	Action
Missing of data occurs. Data Output Completion (GATE) signal and BUSY signal are not out- put from the Sensor Controller.	Since the measurement load on the Sensor Controller becomes heavy, the communication processing for EtherNet/IP is delayed.	Setting Measurement priority to Lower the priority of the measurement process can ease up. Note that the measurement time will delay. For details, refer to Setting the Sta- tus at Startup Startup Settings in the Vision System FH/FHV Series User's Manual (Cat. No. Z365)

2-4-1 Overview of PROFINET

## 2-4 Communicating by PROFINET

This section describes the communication settings, communication specifications, input/output formats, and the communication timing chart required for communications by PROFINET between the Sensor Controller and an external device.

### 2-4-1 Overview of PROFINET

PROFINET is a network for industrial use that applies industrial Ethernet (100 Mbps, Full duplex) to PROFIBUS DP. The specifications are open standards managed by PI (PROFIBUS and PROFINET International), and is used in a wide range of industrial devices.

Since PROFINET uses standard Ethernet technology, it can be mixed with various general-purpose Ethernet devices.

This section describes an overview of PROFINET required to use the FH/FHV series with PROFINET. For details of the PROFINET specifications, refer to documents from IEC1158, ICE61784, and PI.

## Types of PROFINET

PROFINET has two types of standards: PROFINET IO and PROFINET CBA.

• PROFINET CBA

This is inter-device communication using components and mainly used between controllers.

PROFINET IO

This controls between a controller and peripheral devices by I/O data.

The FH/FHV/FZ5 series support PROFINET IO.

PROFINET IO adopts the same device model as PROFINET DP.

The information for each device is described in a GSD (General Station Description) file based on EML (Extensible Markup Language).

#### **Precautions for Correct Use**

- For a network that many devices are connected, temporal heavy load on the network may cause communication errors or lower performance such as response delay or packet loss. Perform the verification under actual conditions before use.
- When operating the network under high load condition, perform the verification under actual conditions before use because a certain margin in measurement cycle time is necessary for stable communications.
- Use the EtherNet connector 2 (lower side) when using FH-1000/FH-3000 series with 4 cameras or 8 cameras and FH-2000/FH-5000 series via PROFINET. The EtherNet connector 1 (upper side) cannot be used for PROFINET communications.
- When using PROFINET communications in multi-line random trigger mode with three lines or more, recommend to use FH-3000/5000 series because it is likely to e a high-load state.
- PROFINET cannot be used together with PLC link or serial (EtherNet).

### **PROFINET IO**

### Communication Specifications for PROFINET IO

Here, describe the communication specifications for PROFINET IO.

Communication specifications	Method	Description	Support on the FH/FHV series
	RT (real-time) com- munication	Uses standard Ethernet hardware and achieves the same level of performance as the existing Field- bus.	Supported
Periodic data commu- nication method	IRT (Isochronous re- al-time) communica- tion	Provides a higher level of assur- ance about executing communica- tion within a particular time than RT communication. This is assumed to be used in a system requiring strict real-time such as motion control.	Not supported

PROFINET IO has specified the supported functions per conformance class with an awareness of applications.

Class	Overview	Support on the FH/FHV/FZ5 series
Class A	Supports the basic functions of RT communication.	Supported
Class B	Network diagnosis and redundancy functions used in proc- ess automation are added.	Not supported
Class C	Supports IRT communication achieving reliable synchroni- zation.	Not supported

The following functions are defined in Class A.

Function	Overview		
Cyclic data exchange	This is real-time data communication between the IO controller and IO devices per- formed at a determined cycle. This is set by IO data CR.		

Function	Overview		
Acyclic parameter da- ta/device identification	This is used for parameter settings, IO device configuration, and reading device in- formation. This is set by record data CR.		
Device/network diag- nosis	This is communication to upload alarms and status from IO devices to the IO con- troller. This is set by alarm CR.		

### Device Types Used in PROFINET IO

The following devices are defined in PROFINET IO.

Method	Description	
IO controller	A controller for external devices.	
IO device	Sensor devices connected to the IO controller.	
	The FH/FHV series correspond to IO devices.	
IO supervisor	A PC or other device to be used for maintenance and diagnosis.	

### IO device

IO devices consist of DAPs and IO modules.

The functions and characteristics for the devices are described in a GSD file.

DAP (Device Access Point):

This is an Ethernet access point to be used in a communication program.

IO module:

This is composed of the following Slot, Sub-slot, and Index and has one or multiple slots.

Slot:

This indicates the location for IO modules located in the IO device.

· Sub-slot:

This is an IO interface in the Slot. This defines data types such as bit data and byte data, and the meanings for the data.

Index:

This is data in the Sub-slot.

### Additional Information

When an I/O device is used in PROFINET, the GSD file that describes the device functions and properties is used to configure the network configuration settings.

When the FH/FHV series are used in PROFINET as an I/O device, the GSD file of the FH/FHV series must be installed in the Engineering Tool.

### Data Exchange in PROFINET IO

A connection so-called AR (Application Relation) must be first established to communicate between an IO controller and an IO device.

When the AR connection has once established, data communication between the IO controller and IO device is performed with CR (Communication Relation) that defines the details of the data communication

An IO device can establish an AR with each communication device. Moreover, multiple CRs can be defined in one AR.

Defining multiple CRs in one AR enables communications when multiple profiles and/or different Sub-slot are required.

Cycle time can be set per each CR and IO too.

CR is classified into IO data CR, record data CR, and alarm CR.

Within the IO data CR, data communication is performed per an updating task period. Within the other CRs than the IO data CR, communication is performed in between the cyclic data communications.

Within the record data CR, the IO controller transmits commands to the IO devices at any timing and the IO devices send back responses to the IO controller.

### 2-4-2 **PROFINET** Communications

With commands and responses via communications between the PLC and the Sensor Controller using EtherNet/IP tag data link, the PLC can control the Sensor Controller and make it output data after measurements.

The Sensor Controller supports EtherNet/IP conformance tests.

The settings for tag data links are performed with the support software dedicated to it. When you connect to an OMRON Controller to communicate with it via EtherNet/IP, use the Network Configurator to perform the tag data link settings such as tag, tag set, and connection setting. This section describes how to use the Network Configurator to perform tag data link settings. For details of the tag data link settings using Network Configurator, refer to the following manuals.

- NJ-series CPU Unit Built-in EtherNet/IP Port User's Manual (Cat. No. W506)
- CS/CJ-series EtherNet/IP Units Operation Manual (Cat. No. W465)

• *CJ-series EtherNet/IP Units Operation Manual for NJ-series CPU Unit (Cat. No. W495)* For details, refer to .

2-4-3 Communications Processing Flow

#### **Precautions for Correct Use**

- Since a reasonable amount of measurement takt time is required to have stable communications in an operation under high load, verify the operation under the conditions that are to be actually applied.
- On a network to which many devices are connected, performance may drop (e.g., responses may be delayed or packets lost) or communications errors may occur when there is temporarily high traffic on the network. Test the operation under actual conditions before you start actual operation of the system.
- When the measurement interval is short, the measurement processing load is high, or command processing for operations such as scene group changing is time-consuming, the Sensor Controller prioritizes measurement processing and control processing over communication processing. As a result, communication between an external device and the Sensor Controller may be temporarily interrupted, and a communication error may occur.

In this case, set the communication error timeout time longer than the Sensor Controller's processing time, or lengthen the measurement interval. Set the communication error timeout time in the tag data link connection settings<sup>\*1</sup>as follows:

*Timeout value* > Measurement time on Sensor Controller.

\*1: Use Support Software, such as the Network Configurator, to change the tag data link connection settings.

For details of setting the tag data links using the Network Configurator, refer to 2-3-8 Setting Tag Data Link on page 2-206.

### 2-4-3 Communications Processing Flow

In PROFINET communications, the following five communication areas are set in the PLC (IO controller).

Input module for the Sen- sor Controller (Input Data)	(1) Command Area (Com- mand/response method)	This area is used that you write control commands to perform for the Sensor Controller.
	(2) User Input Area	This area is used that you write the data that you de- fined for the Sensor Controller.
Output module from the Sensor Controller (Output Data)	(3) Response Area (Command/response method)	This area is used that the Sensor Controller writes the results which the control commands written in the Command Area were performed.
	(4) Data Output Area (Data output after meas- urement)	This area is used that the Sensor Controller writes the output data accompanied with the measurement after measurement performed.
	(5) User Output Area	This area is used that the Sensor Controller writes the data that you defined.

The above five areas are set using an engineering tool such as CX Configurator FDT that can set IO data CR of PROFINET. The areas can be specified by using I/O memory addresses such as CIO or DM.

For details of the IO data CR settings by CX Configurator FDT, refer to 2-4-7 IO Data Communication Settings on page 2-273.

Moreover, when a non-OMRON PLC or PROFINET unit is connected, download the EDS file for the Sensor Controller from our OMRON website and follow the procedures in the user's manual for the external devices to be connected and in the instruction for the software to set IO data CR.

The flow of PROFINET communications between a PLC and the Sensor Controller is as follows.

- \*1 : The Response Area (3) and Data Output Area (4) are assigned to continuous memory addresses or to variables.
- \*2 : You can use output controls (handshaking) to prevent output data from being externally output from the communications buffer until the PLC (master) turns ON the Result Set Request (DSA) signal to request the output data.
- \*3 : For details of the Output Units outputting measurement data, refer to *Settings Required for Data Output* on page 1-21.

2-4-4 Communications Settings

\*4 : Use the Macro Customization Function to input and output to the User Area. For details of the Macro Customization Function, refer to *PROFINET communication of the IO Module List* in the *Vision System FH/FHV Macro Customize Functions Programming Manual (Cat. No. Z367).* 

## 2-4-4 Communications Settings

The following settings are required to use PROFINET.

## 2-4-5 Communications Module Settings (Startup Settings)

The communication method used for communication with the Sensor Controller is selected from the communication modules.

- **1** On the Main window, click **Tool System Settings** to open the system settings.
- **2** On the Multiview Explorer on the left, select **System settings Startup Startup setting** and then click the **Communication** tab.

System Settings	Language Collins	Basic	Commission from the second	0
E Startup	Language Setting	Dasic	Communication	Operation mod
Startup setting				
🕀 Camera				
- Camera connection	Communication mod	ule select —		
- Inter-camera setting	Serial(Ethernet)			Test.
Output signal setting	ContailContentey	Norm	nal(UDP)	
Communication	Serial(RS-232C/422) Parallel	Norm	Normal	
- Parallel				
- RS-232C/422(Normal)	Parallel	Stan	dard Parallel VO	
Ethernet(Normal(UDP))	Fieldbus	PRO	CNICT	
🖻 Other		Parcel	THE I	
- Date-time setting	Remote Operation	ON		
- Fan control setting		1 A.A.		

- **3** In the Communication Module Selection Area, select *PROFINET* in the *Fieldbus*, and then click **Apply**.
- 4 Click **Close** in the bottom of the Window.
- **5** Click **Data save** in the Toolbar.

Data save

- **6** On the Main window, click **Function System restart**.
- 7 Click OK in the System restart dialog box to restart the Sensor Controller. When the Sensor Controller was restarted, the set Communication Module will operate with the default settings.
- **8** Set the IP address and other parameters for external devices such as a PLC.

#### Precautions for Correct Use

After you set the Communication Module, always click **Data save** and then restart the Sensor Controller. If the settings are not saved and the Sensor Controller is not restarted, the new Communication Module settings will not be enabled

#### Additional Information

You can save the Communication Module settings to a file. Use the *System data* or *System* + *Scene group 0 data* option for *saving settings to a file*. For details, Refer to *Saving Settings Data to the Controller RAM Disk or an External Storage Device* in the *Vision System FH/FHV Series User's Manual (Cat. No. Z365)*.

# 2-4-6 Communication Specifications Settings

Set the output handshaking and output controls for communications.

### **Precautions for Correct Use**

• Set the Communications Module to *PROFINET* in the startup settings before setting the communications specifications.

For details, Refer to 2-4-5 Communications Module Settings (Startup Settings) on page 2-266 After you selected the Communication Module, save the settings to the Sensor Controller and restart it.

If you do not restart the Sensor Controller, the selected Communication Module will not be enabled.

Furthermore, if the operation mode is set to the Multi-line Random Trigger Mode, the Communications Modules for lines 1 and higher must also be set to *PROFINET*.

• When using Multi-line Random-trigger Mode, specify different addresses for the sending and receiving areas for each line.

# **Setting IP Address**

Set the IP address for the Sensor Controller.

## **Precautions for Correct Use**

Set the same IP address as it set by I/O controller such as a PLC. In PROFINET communications, an IP address set by I/O controller is prioritized.

- **1** On the Main window, click **Tool System Settings** to open the system settings.
- 2 In the tree view on the left, select System Settings Communication Ethernet Normal (xyz) ("xyz" depends on the Communication Module). The Ethernet view is displayed.
- **3** Set each item.
  - UDP case

Address setting					
O Obtain an IP address automatically					
<ul> <li>Use the following IP address</li> </ul>					
IP address:	10				
Subnet mask:	255 255 0				
Default gateway:	10 _ 5 _ 5 _ 100 _				
DNS server:	10 - 5 - 5 - 100 -				
Preferred WINS server :	0 0 0				
Alternate WINS server :	0_0_0_

Output port No. :	-1 - (-1:Same number Input port No)				

#### Additional Information

- Sensor Controllers of the FH-1000/2000/3000/5000 series with four or eight Camera inputs have two Ethernet ports.
  - Set the settings for the two Ethernet ports as follows:
  - Communication Module Settings: Use the same settings for both ports
  - IP Address Setting:
    - Set a different IP address for each Ethernet port.

The IP address for the top Ethernet port is set in *Address setting*, and the IP address for the bottom Ethernet port is set in *Address setting 2*. Note that the FH prioritizes the bottom port, so when there is a high network load, communication on the top port may be delayed or in some cases communication data may be lost. By using both Ethernet ports simultaneously, you can use the bottom port for PLC Link, Non-procedure, EtherNet/IP, or PROFINET communications with a PLC and the top port for FTP or remote operation communications with an external device.

- · The following Sensor Controller type has one Ethernet port:
- FH-L/FHV series
- FH-1000/3000 series with two camera inputs

In this case, the IP address of the Ethernet port is set in Address setting 2

Setting item	Setting value [Factory default]	Description
Address Settings Address Settings is only for the FH-1000 series (4- and 8-cameries, FH-3000 series (4- and 8-ca series	a types), FH-2000 ser-	Set the IP address for the upper Ethernet port on the Sensor Controller.

Setting item	Setting value [Factory default]	Description
	<ul> <li>Obtain an IP ad- dress automatically.</li> <li>[Use the following IP address]</li> </ul>	Set the IP address for the Sensor Controller When Obtain an IP address automatically is selected, the IP address of the Sensor Con- troller will be automatically obtained. When Use the following IP address is selec ed, set the IP address, subnet mask, and the default gateway address.
IP Address	a.b.c.d a: 1 to 223 b: 0 to 255 c: 0 to 255 d: 0 to 254 [10.5.5.100]	Enter the IP address for the Sensor Control ler.
Subnet mask	0.0.0.0 to 255.255.255.255 [255.255.255.0]	Enter the subnet mask address.
Default gateway	a.b.c.d a: 1 to 223 b: 0 to 255 c: 0 to 255 d: 0 to 255 d: 0 to 255 [10.5.5.100]	Enter the default gateway address.
DNS server	a.b.c.d a: 1 to 223 b: 0 to 255 c: 0 to 255 d: 0 to 255 [10.5.5.100]	Enter the DNS server address.
Preferred WINS server	a.b.c.d a: 1 to 223 b: 0 to 255 c: 0 to 255 d: 0 to 255 [0.0.0.0]	Enter the WINS server address.
Alternate WINS server	a.b.c.d a: 1 to 223 b: 0 to 255 c: 0 to 255 d: 0 to 255 d: 0 to 255 [0.0.0.0]	Enter the WINS server address.

Setting item	Setting value [Factory default]	Description
Address Settings 2 Address Settings is only for the FH-1000 series (2-camera type) FH-3000 series (2-camera type) series	), FH-2000 series,	Set the IP address for the lower Ethernet port on the Sensor Controller.

Setting item	Setting value [Factory default]	Description
	<ul> <li>Obtain an IP ad- dress automatically.</li> <li>[Use the following IP address]</li> </ul>	
IP Address	a.b.c.d a: 1 to 223 b: 0 to 255 c: 0 to 255 d: 0 to 255 d: 0 to 254 [10.5.6.100]	
Subnet mask	0.0.0.0 to 255.255.255.255 [255.255.255.0]	Same as "Address Settings".
Default gateway	a.b.c.d a: 1 to 223 b: 0 to 255 c: 0 to 255 d: 0 to 255 [10.5.6.100]	
DNS server	a.b.c.d a: 1 to 223 b: 0 to 255 c: 0 to 255 d: 0 to 255 d: 0 to 255 [10.5.6.100]	
Preferred WINS server	a.b.c.d a: 1 to 223 b: 0 to 255 c: 0 to 255 d: 0 to 255 [0.0.0.0]	Enter the WINS server address.
Alternate WINS server	a.b.c.d a: 1 to 223 b: 0 to 255 c: 0 to 255 d: 0 to 255 d: 0 to 255 [0.0.0.0]	Enter the WINS server address.

**4** Click **Apply** to finish the settings.

Click Close to close the System Settings dialog.

## Precautions for Correct Use

Change the IP address and subnet mask for [Address setting] and [Address setting 2] as required so that each designate a different network address. If the same network address is specified, communications may not be performed correctly.

# Setting the PROFINET Output Specifications

rh7

**1** On the Main window, click **Tool - System Settings** to open the system settings.

## 2 Select System Settings - Communication - PROFINET. The PROFINET view is displayed.

## **3** Set each item.

Setting item	Set value [Factory default]	Description
Judge output polarity	<ul><li>ON at OK</li><li>[ON at NG]</li></ul>	Set the polarity of the judge result output sig- nal.ON at OK: ON when the judgment result is OK. ON at NG: ON when the judgment result is NG.
Error output polarity	<ul><li>[ON at error]</li><li>OFF at error</li></ul>	Set the polarity of the error result output signal.: ON at error: ON when an error occurs. OFF at error: OFF when an error occurs.
Output control	• [None] • Handshaking	Set whether to synchronize with the external device when data is output. Normally, select <i>Handshaking</i> . For details, refer to <i>2-4-16 Data Output</i> on page 2-305. None: The Sensor Controller outputs measurement results without synchronizing with external devices. Handshaking: The Sensor Controller outputs measurement results with synchronizing with external devices.
Output period [ms] <sup>*1</sup>	2.0 to 5000.0 [10.0]	Valid only when <i>Output control</i> is set to <i>None</i> . Set the cycle by which measurement results are output.
Output time [ms] <sup>*2</sup>	1.0 to 1000.0 [5.0]	Valid only when <i>Output control</i> is set to <i>None</i> . Set the cycle by which measurement results are output. Set the ON time for the GATE signal. Set the time required for an external device to acquire meas- urement results.

Setting item	Set value [Factory default]	Description
Timeout [s]	0.5 to 120.0 [10.0]	<ul> <li>Valid only when <i>Output control</i> is set to <i>Handshaking</i>.</li> <li>A timeout error occurs when no response from external devices is received at the following timing within the time that has been set.</li> <li>In the following cases, a timeout error occurs when the state of each signal does not change within the time that has been set.</li> <li>The DSA signal turns ON after measurement has been completed.</li> <li>The DSA signal turns OFF after the GATE flag has turned ON.</li> </ul>
Output data size *3*4	Result Data Format 0 (32 bytes) Result Data Format 1 (64 bytes) Result Data Format 2 (128 bytes) Result Data Format 3 (256 bytes)	Set the data size to output as measurement re- sults for each line. The settings are reflected at the restart after they were stored. There are four types in the output data size: 32, 64, 128, and 256 bytes. Result Data Format 0 (32 bytes) Out put data 0 to 7 of 4 bytes can be used and to- tal size of the output data is 32 bytes. Result Data Format 1 (64 bytes) Out put data 0 to 15 of 4 bytes can be used and total size of the output data is 64 bytes. Result Data Format 2 (128 bytes) Out put data 0 to 31 of 4 bytes can be used and total size of the output data is 128 bytes. Result Data Format 3 (256 bytes) Out put data 0 to 63 of 4 bytes can be used and total size of the output data is 128 bytes.
User area	• [None] • ON	<ul> <li>Set whether or not to use the User Area (user input and output areas)</li> <li>Data type of User Input Area 0 to 3 is DINT. Data type of User Input Area 4 to 5 is LREAL.</li> <li>Data type of User Output Area 0 to 3 is DINT. Data type of User Output Area 4 to 5 is LREAL.</li> </ul>

\*1. Set the period so that the interval is longer than the total of *Otuput time* and *Updating period* (*Update Rate of IO controller*), but less than the measurement interval.

- \*2. Set this value to Updating period (Update Rate of IO controller) or larger.
- \*3. If the total size of the output data exceeded the data size set here, the data will be transmitted at one time but divided into several times.
- \*4. Set the same value as set at the external device.

**4** Click **Apply** to apply the settings.

**5** Click **Close** to close the System Settings dialog box.

### Precautions for Correct Use

#### **PLC Connection Timeout Interval**

Set the *PLC connection timeout interval* so that it is longer than the *measurement processing time*. For the timeout value, refer to 2-3-3 *EtherNet/IP Communications* on page 2-194.

# 2-4-7 IO Data Communication Settings

This section describes how to set data links for PROFINET.

The communication areas in the PLC used for IO data communications with the Sensor Controller are set by assigning the I/O memory address with an engineering tool such as CX Configurator FDT. When an OMRON controller is connected and communicate via PROFINET, use CX Configurator FDT to assign the I/O memory address.

Here, describes how to set the I/O memory address using CX Configurator FDT. For details, refer to *CJ series PROFINET I/O Controller Unit Operation Manual for NJ series CPU Unit(W511-E2-01)*.

# rh1

## Precautions for Correct Use

When connecting to a CPU Unit of NJ series or CJ series, install the GSD file that defines the IO data CR connection information for the Sensor Controller to a tool (e.g. CX Configurator FDT). Download the GSD file from OMRON's website.

# IO Data CR Connection Settings for the Sensor Controller

Each communication area in the PLC is set as IO data CR connections as shown below

### Settings for the Sensor Controller (Module Settings)

- 1 Add an IO device (FZ/FH-XXXX/FHV7) to the IO controller of the CX Configurator FDT.
- 2 Select Configuration -> Modules in the IO device (FZ/FH-XXXX/FHV7).
- **3** Add **Input Data** to the slot 1 and **Output Data** to the slot 2.
- **4** Add a Sub-module to the Sub-slot in Slot 1 and set the data format. Likewise, do slot 2. <sup>\*1</sup> The types of the data format must be the same as the *Output data size* set at PROFINET of the Sensor Controller.

	Slot	Sub SI	1	Module
+	0		푸	FZ/FH-XXXX
-	1		2012	Input Data
1		1	1	(In)Data Format0(32byte)
1-1	2			Output Data
		1		(Out)Data Format0(32byte)
	Add Modi		-	Add Submodule Remove Duplicate

\*1: For Multi-line Random-trigger Mode, add the sub-modules corresponding to the number of lines to the *Input Data* and *Output Data* respectively.

2-4-7 IO Data Communication Settings

Data format		Description		
Size	User area	Command Area	Response Area and Output Area	
32 bytes		(Out) Data Format 0 (32 bytes)	(In) Data Format 0 (32 bytes)	
64 bytes	No	(Out) Data Format 10 (64 bytes)	(In) Data Format 1 (64 bytes)	
128 bytes	No	(Out) Data Format 2 (128 bytes)	(In) Data Format 2 (128 bytes)	
256 bytes		(Out) Data Format 3 (256 bytes)	(In) Data Format 3 (256 bytes)	
32 bytes		(Out) Data Format 0 (32 bytes) +	(Out) Data Format 0 (32 bytes) +	
32 bytes		User Area	User Area	
64 bytes		(Out) Data Format 1 (64 bytes) +	(In) Data Format 1 (64 bytes) +	
04 Dytes	Yes	User Area	User Area	
128 bytes	165	(Out) Data Format 2 (128 bytes)	(In) Data Format 2 (128 bytes) +	
120 Dytes		+ User Area	User Area	
256 bytes		(Out) Data Format 3 (256 bytes)	(In) Data Format 3 (256 bytes) +	
200 Dytes		+ User Area	User Area	

#### Sub-module setting for the Sensor Controller

#### **Precautions for Correct Use**

- For the settings for *IO Device Area* on the IO controller (PLC), set the data length to be assigned to the I/O memory address so that it is same or longer than the value indicated in the *Occupied*.
- If the IO data communications were interrupted, increase the value of *Data Hold Factor* and *Watchdog Factor* respectively by clicking **Configuration IO Device Setup**.

#### • Maximum size for the data output in Multiple-line Random-trigger mode

When a OMRON PROFINET interface unit is used, the allocatable data size to the slots in the Multiple-line Random-trigger mode will be limited up to 416 bytes.

Therefore, refer to the following table and set the total of occupation data size for all lines not to exceed 416 bytes.

Data f	Occupation data size	
Size	User area	Occupation data size
32 bytes		48 bytes
64 bytes	No	80 bytes
128 bytes	INO	144 bytes
256 bytes		272 bytes
32 bytes		80 bytes
64 bytes	Yes	112 bytes
128 bytes	fes	176 bytes
256 bytes		304 bytes

2-4-8 Output Data Settings (Processing Item Registration)

## 2-4-8 Output Data Settings (Processing Item Registration)

Here, set the output items and output format to be used with PROFINET. This processing item is not available in the FHV series. When you set output data in the FHV series, refer to *2-4-9 Setting Output Data (Numerical Values and Character Strings)* on page 2-279.

# **Registering Processing Items**

Register the processing items for data output in the measurement flow.

- **1** Click **Edit flow** in the Toolbar.
- 2 Select the **Fieldbus Data Output** processing item in the processing item tree.

🕂 📋 Out	put result
🛄	Data Output
🗵	Parallel Data Output
🌆	Parallel Judgement Output
📓	Fieldbus Data Output

## **3** Click **Append**.

The Fieldbus Data Output processing item is added at the bottom of the unit list (flow).

4 Click the **Fieldbus Data Output** icon and set the data output items and data format. For details of the settings, refer to the following. *Registering the Items to Output* on page 2-276

## Precautions for Correct Use

### Fieldbus Data Output

Perform the communication settings before the settings of Fieldbus Data Output. Note that if you changed the communication settings after the settings of Fieldbus Data Output, the changed settings will not be displayed on the Fieldbus Data Output setting display.

#### **Additional Information**

 The number of outputtable items for single data output processing is 8 depending on data output settings in each lines. If you need to output more data items, use more than one Output Unit.

However, the data is output to the same destination, so if you do not control the output, the output data that was output first will be overwritten by the output data that is output after it. Use the following method to read each set of output data.

	If handshaking is used to control data output, the timing of outputting the			
	data is controlled by I/O signals.			
Controlling Data Output	Each time that data is output, read the output data and move it to a different			
with Handshaking part of I/O memory in the PLC.				
	For detail of handshaking, refer to Data Output Control with Handshaking			
	on page 1-25.			
Data is output in the order that data output is registered in the measurement flow, i.e., the				
timing is different for each data output processing item (Data output is executed in the order				

timing is different for each data output processing item. (Data output is executed in the order that it is executed in the measurement flow.)

For details, refer to Outputting the Measurement Data on page 1-18.

# **Registering the Items to Output**

Set the output data with expressions.

- 1 Click the Fieldbus Data Output I icon in the measurement unit list (flow).
- **2** In the Item tab area, click **Setting**.
- **3** In the list, click the output data number to set the expression.

Fieldbus Data Out	put		
Setting	Output format		
	ent Expression		×
No. 0 Comment: Expression :			
	0000		

The selected output data number is displayed under the list.

**4** Click — next to the expression text box and set the expression.

Specify the processing items, measurement results, and measurement data in the expression. Arithmetic or function calculations can be applied to the measurement data to output. For details of the calculation settings, refer to *Calculation* in the *Vision System FH/FHV Series Processing Items Reference Manual (Cat. No. Z341).* 

**5** Click for the **Comment** text box and enter the description for the expression. The entered comment will be displayed in the detailed results area on the Main window. For example, *Test* was entered as the comment for the expression 0, *Test* will be displayed instead of *Expression 0* in the detailed results areas on the Main window.

**b** Repeat step 3 to 5 to set expressions for all of the required output data numbers.

## Additional Information

If you delete one of the expressions that is set for output data 0 through 7, the output numbers for all expressions after the deleted expression will stay the same. However, the actual data output will be output as though the list has been shifted forward for the number of expressions that have been deleted.

To prevent data from being written to the wrong locations, use copy and paste to shift the expressions after the deleted number forward.

For details of the Data Output Area, refer to 2-3-12 *Memory Allocation* on page 2-224. Example: If the Expression for Output 1 Is Deleted

Output Item Settings Data Output The Defected Data Output Destination (Data Output Area)

2-4-8 Output Data Settings (Processing Item Registration)

# Output Format (Fieldbus Data Output)

- 1 Click the Fieldbus Data Output I icon in the measurement unit list (flow).
- 2 In the item tab area, click **Output format**.

# **3** Select the output format.

Output Setting	
Decimal output form :	
Fixed point	C Floating point

Setting item	Setting value [Factory default]	Description
Decimal output format	<ul><li> [Fixed point]</li><li>Floating point</li></ul>	<ul> <li>Fixed point Data is output multiplied by 1,000. ex.: For 123.456, it will be 0x0001E240.</li> <li>Floating point Data is output in floating point format. ex.: For -123.4567, it will be 0xc2f6e979.</li> </ul>

# 2-4-9 Setting Output Data (Numerical Values and Character Strings)

# **Registering Processing Items**

Register the processing items for data output in the measurement flow.

1 In the Main window, click **Edit flow** in the Toolbar.

## 2

Click **Result output (I/O)** in the processing item tree.

# **3** Click **Append**.

The Result output (I/O) processing item is added at the bottom of the unit list (flow).

4 Click **Result output (I/O)** icon in the unit list (flow) or **Set** to set the output device and the output data.

# Setting the Output Device

Here, set a communication method when data is output.

1 Click **Result output (I/O)** icon in the unit list (flow) or **Set** to set the output device and the output data.

The Result output (I/O) setting window is displayed.

0	1. Result output (I / O)						$\times$
	Output setting						
N		Data Type	Data	Value	Title		
0							
Ļ							
	A V Inser	t Delete E	Edit				
							~
	][				ок	Cancel	
					UN	Cancel	

## 2 Click Output setting.

The Output setting window is displayed.

Output setting		
Output device : Not selected		~
	ок	Cancel

**3** Click at the right side of the **Output device** text box to select the communication method to use.

Output setting		
Output device :	Not selected	~
-	Not selected Serial(Ethernet) Serial(RS-232C/422) Fieldbus	

#### **Precautions for Correct Use**

- The displayed output device is determined based on the selection of **Communication module** in the **System settings** in the item tab.
- Executing measurements without an output device selected causes a failure (NG: No measurement) in the judgment of the processing unit.

# Setting the Output Data

Here, set the data to output such as processing item data or fixed character strings.

1 In the item tab area, click **Output data**.

The Result output (I/O) setting window is displayed.

	👝 1. Re	sult output (I / O)					- 🗆 ×

a) Setting data display area

The No. (output number), Offset (indicating the byte position from the beginning), Data type (integer, double, string), Data, Value, and Title (data description) are displayed in this area. A value is displayed when a variable is assigned to data.

b) Output data display area

Contents in the output data display area in binary (Hex) are displayed in this area.

c) Button

Button	Description
	Moves the selected data up one position.
•	Moves the selected data down one position.
Insert	Adds new data to the selected data position.
Delete	Deletes the selected data. The following data moves up after the deletion.
Edit	Edits the selected data.

Button	Description
ОК	Saves the current settings and returns to the previous view.
Cancel	Discards the current settings and returns to the previous view.

2 In the list, select the output data number to set the output and then click **Insert**. The following **Output data editing** dialog box is displayed.

Output data editing			
Data Type	Data	Title	
	~	- M3	-
String setting			
Size	e: 10 -		
Character code	e: 0 -		
	When using language	dependent characters, please specify the code page according to that language.	
			_
		OK Car	ncel

s	Setting item	Setting value [Factory default]	Description						
		Integer							
Data type		Double	Sets the data type.						
		String							
			There are two input methods. <sup>*1</sup>						
Data	a	-	Enter strings directly						
			Assign variables						
Title		-	Enters the description for data.						
Strir	ng settings		Valid when String is selected in the Data type.						
	Size	0 to 4,095	Sets the number of characters.						
	[10]		Sets the number of characters.						
Character [0] code		[0]	Sets the code page according to the language to be used.						

\*1. Any arithmetic expression cannot be used. If it is used, it will be handled as character strings.

• Character code: Specify the following code page for each language.

Language	Code page	Language	Code page	Language	Code page
Japanese	932	English	1252	Chinese (simplified)	936
German	1252	French	1252	Chinese (traditional)	950
Italian	1252	Spanish	1252	Korean	949
Vietnamese	1258	Polish	1250		

• The default 0 is no language-dependent letters in ANSI code page.

• If non-existing code page is selected, corresponding data is handled as invalid data (NULL).

**3** Click at the right side of the **Data type** text box to select the data to output. *Integer, Double,* or *String* are selectable.

	nous for Connecting and Continuincating with External Devices
Data type	Description
Integer	<ul> <li>Entered data is handled as four-byte data.</li> <li>Allowable entering range is a range of signed INT.</li> <li>When string variables are specified for data, character strings like digits which can be converted into numerical values will be converted and output.When decimal digits are included, they are truncated.Moreover, they are handled as "0" if they are not convertible.</li> </ul>
Double	<ul> <li>Entered data is handled as eight-byte data.</li> <li>The allowable entering range is a range of eight-byte floating decimal value.</li> <li>When string variables are specified for data, character strings like digits which can be converted into numerical values will be converted and output. Moreover, they are handled as "0" if they are not convertible.</li> </ul>
	Entered data is set based on specified Size.

	Entered data is set based on specified Size.
	Example: Size is four and the entered data is ABCD.
	$ABCD \rightarrow ABC+NULL$
	<ul> <li>The number of allowable entering characters is up to 4,095.</li> </ul>
	If this limit is exceeded, nothing is displayed and output.
String	• When NULL is included in the entered character string, the character string fol-
	lowing NULL is not output.
	• The following escape sequence codes can be entered. The entered escape se-
	quence codes are handled as fixed character strings.
	\N: Carriage return, \r: Line feed, \t: Tab, \xXX: ASCII code specified by "XX"
	(numerical value), \": Double quotation mark, \\: Backslash

4 Enter data into Data text box.

Data that can be output with one data No. is a range only to be handled as one string.

- 1) When directly entering an output content into the Data text box. A string enclosed with " " (double quotation marks) handled as one string and the rest following it is not output. Example: "AA"TEST  $\rightarrow$  only "AA" is output.
- 2) In the case where assignment variable is assigned o data:

Directly enter a variable name (Scene variable: SC.~) or specify a variable in Variable

assignment window displayed by clicking

- · Only one variable is valid for one data No. Example: SC.A+SC.B $\rightarrow$  Only SC.A is output.
- When a fixed string, e.g. AA, is entered before a variable, the subsequent variable is also handled as a fixed string.

Example: AA+SC.AA& → "AA+SC.AA&"

• When "String" is selected in the "Data type" but "Integer" or "Double" is set to the variable, then the variable is converted to a string and then output.

	Y			
Variable name	Туре	Туре	Comment	1
Do not assign				
SC.AAA&	Scene	Integer		
SC.BBB#	Scene	Double		
SC.CCC\$	Scene	String		
SC.DDD&(0)	Scene	Integer array		
SC.EEE#(0)	Scene	Double array		
SC.FFF\$(0)	Scene	String array		
SY.MOJIRETSU\$	System	String		
SY.SYSTEM_A&	System	Integer		
SY.SYSTEM_B&	System	Integer		
SY.SYSTEM_C&	System	Integer		
SY.SYSTEM_D&	System	Integer		

**5** Enter *Title* that indicates the content of output data.

When String is selected in Data type, the following items in String setting area also needs to be set.

String setting
Size: 10 -
Character code: 0 -
When using language dependent characters, please specify the code page according to that language.

#### Example:

7 Click **OK** in the end of entering data to close the settings.

2-4-10 Testing Communications

# 2-4-10 Testing Communications

Here, check whether or not the PROFINET communication settings are correct. If communications cannot be established after the setup, use the following procedures to check the setting details and the communication status.

# **Before Testing Communications**

Here, *Serial (Ethernet) - Normal (UDP)* communication module is used as an example to describe the procedures.

When checking the communication settings, stop the program on the PLC.

# **Checking Communication Settings**

Use the following procedures to check whether or not the communication settings are correct.

Subnet mask: 2 Default gateway: DNS server: Preferred VINS server: Alternate VINS server: Alternate VINS server: Control of the server:	10 0 0 0 0 0 0 10 0 0 10 0 0 0 10 0	<ol> <li>On the Main Window, select [Tool] – [System Settings]. In the tree view on the left, select [System Settings] – [Communication] – [Ethernet Normal (xyz)]. ("xyz" depends on the Communications Module.)</li> <li>Set the IP address of the Sensor Controller. The default settings are as follows: Address setting: 10.5.5.100 Address setting 2: 10.5.6.100</li> </ol>
Setting Output control : Output period [ms] : Output time [ms] : Timeout [s] :	None	<ul> <li>3. On the Main Window, select [Tool] - [System Settings]. Select [System Settings] - [Communication] - [PROFINET] from the tree view on the left.</li> <li>4. Click the [Settings] tab.</li> <li>5. Set the output control. Set whether to provide an interlock with the PLC when performing data output.</li> <li>* Output Period Set the cycle by which measurement results are output. Set the value so that the interval is longer than the output time and shorter than measurement interval. Output time</li> <li>Set the interval during which the GATE signal (the signal that tells the PLC when to read the measurement results) is ON. This interval must be longer than the cycle time of the PLC and the PROFINET updating interval (Update Rate). Set these values so that they satisfy the following relationships: Updating interval (Update Rate) &lt; Output time GATE ON time = Output time GATE OFF time = Output time are only valid when output control is set to [None].)</li> </ul>
		6. This completes the Controller settings. The PLC settings are set next.

# **Checking the Communication Status**

Use the ping command to check whether or not the Sensor Controller exists on the Ethernet network. With it, check that the Sensor Controller IP address has been correctly set and is correctly connected to the Ethernet network.

### Additional Information

The ping command uses the ICMP protocol to send a response request to a device connected through an Ethernet network and determines the time required to respond to that request. If you properly receive a response from the destination device, the network connection and network settings are correctly set.

2-4-10 Testing Communications

1 Connect the Sensor Controller and a computer with an Ethernet cable. Set the high-order digits of the computer IP address to the same values as the Sensor Controller and the low-order one digit to a different value.

<IP Address Setting Example>

Device	Example					
Sensor Controller	10.5.5.100 (default)					
Computer	10.5.5.101					

Open the Windows command prompt on the computer and perform the ping command.
 At the > prompt, type *ping*, followed by a space and the Sensor Controller IP address, and then press *Enter*.
 Example:

C:\>ping 10.5.5.100

**3** After a few seconds, *Reply from* followed by the IP address of the Sensor Controller (e.g., 10.5.5.100) are displayed, it means that the Sensor Controller is connected to the Ethernet network properly.

Example: Reply from 10.5.5.100: byte=32 Time<1 ms TTL=128

If anything other than *Reply from* is displayed:

The Sensor Controller is not connected to the Ethernet network for some reason. Check the following.

- Are the high-order three digits of the IP addresses for the computer and the Sensor Controller the same?
- Is the Ethernet cable correctly connected?

**4** Use the ping command to check the communication status of the PLC as well. After you have confirmed the communication status as described above, transmit a measurement command to the Sensor Controller in practice to check the communication operations as the Vision Sensor.

## 2-4-11 Memory Allocation

This section describes the assignments of the Command Area for the input connection to the Sensor Controller and the Response Area and Output Area for the output connection to the PLC.

# Input Connection to the Sensor Controller (PLC (IO Controller) to Sensor Controller (IO Device))

For the input connections to the Sensor Controller, specifies the control inputs, command codes, command parameters, and User Input Area, which are the Command Area parameters.

STEP	Measure Bit	Performs measurement one time.				
XEXE	Flow Command Request Bit	Instructs a command execution during the execution of the Field- bus flow control.				
ERCLR	Error Clear Bit	Clears the ERR signal from the Sensor Controller.				
CMD-CODE	Command Code	Stores the command code.				
CMD-PARAM	Command parameters	Stores the command parameters.				
User Input Area 0 to 5	User Input Area 0 5	<ul> <li>This area is used that you write the data that you defined for the Sensor Controller.</li> <li>Data type of User Input Area 0 to 3 is DINT. Data type of User Input Area 4 to 5 is LREAL.</li> </ul>				

# Output Connection to PLC (Sensor Controller (IO Device) to PLC (IO Controller))

For output connections to the PLC, execution results and output data from the Sensor Controller are set. The execution results such as control outputs, command codes, response codes, and response data are output to the Response Area, and the output data from the Sensor Controller or the User Output Area is output to the Data Output Area.

#### Additional Information

The order in which data is stored depends on the manufacturer of the connected PLC. For details, refer to *A-1-1 Parameter Notation Examples for Command Control* on page A-2.

Signal	Signal name	Function			
FLG	Command Comple- tion Bit	Turns ON when command execution is completed.			
GATE	Data Output Com- pletion Bit	Turns ON when data output is completed.			
BUSY	Command Busy Bit	Turns ON when command execution is in progress and turns OFF automatically when the execution was competed.			
OR	Overall judgment	Turns ON when the overall judgment is NG. (The OR signal is output only when the <i>Output</i> option is selected in the Adjustment window.)			

Signal	Signal name	Function
XFLG	Flow Command Completion Bit	Turns ON when execution of an entered command during the execution for the Fieldbus flow control is completed, i.e. XBUSY: ON to OFF).
XBUSY	Flow Command Busy Bit	Turns ON when an entered command is in execution during the execution of the Fieldbus flow control.
XWAIT	Flow Command Wait Bit	Turns ON when a command can be entered during the execu- tion of the Fieldbus flow control.
RUN	Run Mode	Turns ON when the Sensor Controller is in Run Mode.
ACK	Command Recep- tion bit	Turns ON when Measurement Bit (STEP) or Command Execu- tion Bit is turned ON. Turns OFF after the command execution was completed and either the STEP Bit or EXE Bit is OFF.
ERROR	Error Signal	Turns ON when the Sensor Controller detects an error signal.
CMD-CODE	Command Code	Returns the executed command code.
RES-CODE	Response Code	Stores the response data for the executed command.
RES-DATA	Response Data	Stores the response data for the executed command.
DATA0 to 7	Output data 0 to 7	Outputs the data set in the output processing item. When more than one processing item exists, data is overwritten on this area by performing handshaking.
User Output Area 0 to 5	User Output Area 0 to 5	<ul> <li>This area is used that the Sensor Controller writes the data that you defined using Macro customize functions.</li> <li>Data type of the User Output Area 0 to 3 is DINT. Data type of the User Output Area 4 to 5 is LREAL.</li> </ul>

## Accessing Communication Areas Using Variables by NJ series Controllers

In Controllers of the NJ series, I/O memory addresses assigned to each communication area can be accessed from the user program only via variables.

Follow the procedures below.

## • Specify the I/O memory addresses to access each communication area

By setting AT specifications to variables, assigned destination to each communication area can be specified in the unit of the I/O memory address.

**1** Setting IO Device Area (CX Configurator FDT)

Directly specify the input and output allocation from the IO controller to the IO device by using the I/O memory addresses allocated to each communication area. (Output Allocation: Command Area to the Sensor Controller, Input Allocation: Response Area and Data Output Area from the Sensor Controller)

#### Setting example

IO Device Area	Area	Start Address	Length
Output Allocation	DM	0	100
Input Allocation	DM	100	100

2 Setting Variables

Define variables with AT (assigned destination) specifications to the I/O memory addresses assigned to each communication area as shown below.

## Setting example

Variable	AT specification	Data type
SensorOut_EXE	D0.0	BOOL
SensorOut_STEP	D0.1	BOOL
SensorOut_ERCLR	D0.15	BOOL
SensorOut_DSA	D1.0	BOOL
SensorIn_FLG	D100.0	BOOL
SensorIn_BUSY	D100.1	BOOL
SensorIn_GATE	D101.0	BOOL
SensorOut_CommandCode	D2	BOOL
SensorIn_ResponseData	D106	DINT
SensorIn_Data	D108	ARRAY[07] OF DINT

# 2-4-12 I/O Signals

The following tables list the signals used to control I/O for PROFINET.

# Input Signals

			ON/OFI	F timing
Signal	Signal name	Function	OFF to ON	ON to OFF
EXE	Command Re- quest Signal	The user (PLC) turns this signal ON when is- suing a command to the Sensor Controller.	The user (PLC) turns this signal ON when is- suing a command (in- struct the execution) to the Sensor Controller based on the command code and command pa- rameters.	The user (PLC) switches this signal from ON to OFF when the Sensor Controller turns the Command Completion (FLG) sig- nal ON. <sup>*1</sup>
DSA (Used only for handshaking output control)	Data Output Request Signal	During handshaking, the user (PLC) issues this signal to the Sensor Controller to request to output externally the measured results per- formed in the measure- ment flow. When this signal is ON while an Output Unit (Fieldbus Data Output Unit) in the measure- ment flow is performed, the Sensor Controller outputs the data of the processing item.	<ul> <li>The user (PLC) turns this signal ON when requesting the measurement data to output externally.*3</li> <li>This DSA signal is turned ON at the same time as the Trigger (STEP) or Command Request (EXE) signal switches from OFF to ON. When more than one Output Units is used to output units is used to output more than eight data, turn ON this DSA signal again after the GATE signal for the first data output turns OFF. For details, refer to2-3-18 Timing Chart on page 2-249.</li> </ul>	The user (PLC) switches this signal from ON to OFF when the Sensor Controller turns the GATE signal ON.*2
ERCLR	Error Clear Bit	This is turned ON when the Error (ERR) signal from the Sensor Con- troller will be cleared.	The user (PLC) switches the signal from OFF to ON when the Error (ERR) signal from the Sensor Controller is turned OFF.	This signal is turned OFF when the user (PLC) detected the Er- ror (ERR) signal turned OFF.

Signal	Cignal nome	Function	ON/OFF timing			
Signal	Signal name	Function	OFF to ON	ON to OFF		
XEXE	Flow Com- mand Request	This is turned on when a command will be per- formed while PLC Link, Fieldbus, or parallel flow control are per- formed.	The user (PLC) switches the signal from OFF to ON when it in- structs an entered com- mand execution during the execution of the Fieldbus flow control.	This signal switches from ON to OFF when the Flow Command Completion (XFLG) sig- nal is turned ON.		
STEP	Measurement Trigger	This is turned on when measurements will be performed.	This signal turns ON from the PLC) to per- form measurement after confirming that the BUSY signal and the Command Execution Completion (FLG) sig- nal have turned OFF.	The user (PLC) switches this signal from ON to OFF after detecting that the Sen- sor Controller turned the BUSY signal ON.		

\*1. If the Command Request (EXE) signal does not switch from ON to OFF within 10 seconds after the Command Completion (FLG) signal was turned ON, a timeout error will occur, and the FLG signal is forced to be turned OFF.

\*2. If the Data Output Request (DSA) signal does not switch from OFF to ON within the time set at the "Timeout" in the PROFINET settings after the Data Output Completion (GATE) signal turned ON, a timeout error will occur and the measurement data prepared for output will be discarded.

\*3. If the Data Output Request (DSA) signal does not switch from OFF to ON within the time set at the "Timeout" in the PROFINET settings after the measurement processing started by the Measurement Trigger (STEP) signal or the Command Request (EXE) signal turned ON, a timeout error will occur and the measurement data prepared for output will be discarded.

# **Output Signals**

Cianal	Signal name	Function	ON/OFF timing				
Signal	Signal name	Function	OFF to ON	ON to OFF			
BUSY	Busy	This signal indicates that external inputs such as commands cannot be accepted. Is- sue a command when this signal is OFF. *1*2*3	This signal turns ON when the Sensor Con- troller receives a com- mand from the user (PLC). (After the EXE signal switches from OFF to ON.)	The signal turns OFF when the command ex- ecution is completed.			
FLG	Command Ex- ecution Com- pletion	The Sensor Controller uses this signal to in- form the PLC that com- mand execution has been completed.	The signal turns ON when the Sensor Con- troller completes execu- tion of a received com- mand.	This signal is turned OFF when the user (PLC) switches the Command Request (EXE) signal from ON to OFF.			

Olana I	Cincela	<b>F</b>	ON/OFF timing				
Signal	Signal name	Function	OFF to ON	ON to OFF			
GATE	Data Output Completion Signal	The signal informs the PLC of the timing to load output data. "ON" of this signal indi- cates that the Sensor Controller is outputting the data. The user (PLC) starts to load the data when the signal turns ON.	<ul> <li>Without handshaking The signal turns ON when the Sensor Controller performs the Output Unit (Fieldbus Data Out- put Unit)<sup>*4</sup> in the measurement flow and is ready for the data output.</li> <li>With handshaking The signal turns ON when the Sensor Controller performs the Output Unit (Fieldbus Data Out- put Unit)<sup>*4</sup> in the measurement flow and is ready for the data output and the Data Output Request (DSA) signal is ON.</li> </ul>	<ul> <li>Without handshaking The signal turns OFF after the <i>Output Time</i> set in the PROFINET settings has passed.</li> <li>With handshaking This signal is turned OFF when the user (PLC) switches the Data Output Request (DSA) signal from ON to OFF.</li> </ul>			
ERR	Error Signal	The signal indicates that the Sensor Control- ler detects the following errors. For details of the errors, refer to <i>Error Messages</i> <i>and Troubleshooting</i> in the Vision System FH/FHV Series User's Manual (Cat. No. Z365)	The signal turns ON if the Sensor Controller detects an error.	The signal turns OFF when the error is fixed and the user (PLC) turns the Error Clear (ERCLR) signal ON.			
RUN	Run Mode	The signal indicates that the Sensor Control- ler in RUN Mode.	The signal turns ON when the Sensor Con- troller is in Run Mode.	The signal turns OFF when the Sensor Con- troller is in Adjustment Mode.			
OR	Overall judg- ment	The signal indicates the overall judgment re- sults.	The signal turns ON when the overall judg- ment is NG.	The signal turns OFF when the overall judg- ment is OK.			
ACK	Command Re- ception Command Re- ception Command Re- ception Command Re- ception Command Re- tects the completion the command proc ing execution.		The signal is turned ON when Measure Bit (STEP) or Command Execution Bit (EXE) is received.	The signal switches from ON to OFF after the execution complet- ed and either the STEP Bit or EXE Bit is OFF.			

Signal	Signal name	Function	ON/OFF	<sup>=</sup> timing
Signal	Signal name	Function	OFF to ON	ON to OFF
XFLG	Flow Com- mand Execu- tion Comple- tion	The signal indicates that a command per- formed during execu- tion of the Fieldbus flow control has been com- pleted.	The signal is turned ON when a command per- formed has been com- pleted (XBUSY switch- ed from ON to OFF) during execution of Fieldbus flow control.	The signal switches from ON to OFF when the Flow Command Busy (XBUSY) signal switches form OFF to ON during the execu- tion for the Fieldbus flow control.
XBUSY	Flow Com- mand Busy Bit	The signal indicates that a command en- tered during the execu- tion of the Fieldbus flow control is in execution.	The signal switches from OFF to ON when a command entered dur- ing the execution for the Fieldbus flow control is in execution.	The signal switches from ON to OFF when a command execution en- tered during the execu- tion of the Fieldbus flow control has been com- pleted.
XWAIT	Flow Com- mand Wait Bit	The signal indicates that a command en- tered can be accepted during the execution of the Fieldbus flow con- trol.	The signal switches from OFF to ON when a command can be input during the execution of the Fieldbus flow con- trol.	This signal switches from ON to OFF when a command cannot be entered during the exe- cution of the Fieldbus flow control.

\*1. Although the BUSY signal remains ON during continuous measurement, the Sensor Controller accepts the Command Request (EXE) signal only when the End Continuous Measurement command is performed.

\*2. This will not be detected while commands received through any other protocol are processed. (Ex.: This signal remains OFF during measurement with the STEP signal in the Parallel communications.) If you use more than one protocol and need to detect command execution, use the BUSY signal in Parallel communications.

\*3. "ON" of this signal does not mean that a command is currently performed. To check whether a command is being executed, refer to the Command Execution Completion (FLG) signal.

\*4. This occurs when the measurement flow is performed in order from the top and the Output Unit is executed, not at the moment when measurement execution was completed.

## 2-4-13 Output Items

# Measurement Results for which Output is Possible (Fieldbus Data Output)

The following data can be output using the processing items related to the Result Output. Measurement values are also referred using processing units such as expressions.

Measurement items	Character string	Description
Judgment	JG	Judgment result
Data 0 to 7	D000 to D007	Results of expressions set for output data 0 to 7.

# **External Reference Tables (Fieldbus Data Output)**

By specifying a number, the following data can be referred using control commands or processing items having a set/get processing unit data function.

Number	Data name	Set/Get	Data range
0	Judgment	Get only	0: No judgment (unmeasured) 1: Judgment result OK -1: Judgment result NG
5 to 12	Data 0 to 7	Get only	<ul> <li>ASCII:-99999999999999 to 999999999999999</li> <li>Binary: -2147483.648 to 2147483.647</li> </ul>
150	Output type	Set/Get	0: Fixed point 1: Floating point

2-4-14 Command List

## 2-4-14 Command List

This section describes the commands used in PROFINET.

A command with command words in the Command Area first channel can be performed in IO data communications.

For details of commands in IO data communications, refer to A-1-4 Command Details for PLC Link, EtherNet/IP, EtherCAT, and PROFINET on page A-15.

## • Execution Commands

First word in Response Area		Function	Reference
+3	+2		
0010	1010	Performs measurement one time.	page A-15
0010	1020	Performs continuous measurement.	page A-15
0010	1030	Ends continuous measurements.	page A-16
0010	1040	Performs test measurement for the specified unit.	page A-16
0010	2010	Clears all measurement result values.	page A-17
0010	2020	Clears the data output buffer.	page A-18
0010	3010	Saves the current system data and scene group data in the Sensor Controller.	page A-19
0010	4010	Registers the model again.	page A-20
0010	5010	Shifts the image display position by the specified amount.	page A-21
0010	5020	Zooms the image display in or out by the specified factor.	page A-21
0010	5030	Returns the display position and display magnification to their default values.	page A-22
0010	7010	Copies the scene data.	page A-24
0010	7020	Deletes the scene data.	page A-25
0010	7030	Moves the scene data.	page A-25
0010	8020	Loads the specified registered image as the measurement image.	page A-26
0010	9010	Returns an entered text string without changing it.	page A-27
0010	B010	Branches to the start of the measurement flow (processing unit 0).	page A-30
0010	F010	Restarts the Sensor Controller.	page A-30

## Commands to Get Status

First word in Response Area		Function	Reference
+3	+2		
0020	1000	Gets the current scene number.	page A-31
0020	2000	Gets the current scene group number.	page A-31
0020	4000	Gets the number of the layout that is currently displayed.	page A-32
0020	5010	Gets the number of the Unit that is currently displayed in the specified image display window.	page A-33

First word in Response Area		Function	Reference
+3	+2		
0020	5020	Gets the sub-image number that is currently displayed in the specified image display window.	page A-33
0020	5030	Gets the image mode for the specified image display win- dow.	page A-35
0020	7010	Gets the input status (prohibited/permitted) for the Commu- nications Modules.	page A-35
0020	7020	Gets the output status (prohibited/permitted) to an external device.	page A-36
0020	8010	Gets the ON/OFF status for the specified parallel I/O termi- nal.	page A-38
0020	8020	Gets the ON/OFF status of all parallel terminals except for DI terminals.	page A-40
0020	8030	Gets the ON/OFF status of all parallel DI terminals.	page A-42
0020	A000	Gets the current state of the operation log.	page A-45

## • Commands to Set Status

First word in Response Area		Function	Reference
+3	+2		
0030	1000	Switches to the specified scene number.	page A-46
0030	2000	Switches to the scene group with the specified number.	page A-46
0030	4000	Sets the layout number and switches the image.	page A-48
0030	5010	Sets the number of the Unit to display in the specified im- age display window.	page A-49
0030	5020	Sets the number of the sub-image to display in the specified image display window.	page A-49
0030	5030	Sets the image mode for the specified image display win- dow.	page A-50
0030	7010	Permits/prohibits inputs to the Communications Modules.	page A-51
0030	7020	Permits/prohibits outputs to external devices.	page A-52
0030	8010	Sets the ON/OFF status of the specified parallel I/O termi- nal.	page A-52
0030	8020	Sets the ON/OFF status of all parallel terminals except for DO terminals.	page A-55
0030	8030	Sets the ON/OFF status of all parallel DO terminals.	page A-57
0030	A000	Sets the state of the operation log.	page A-60

#### • Commands to Read Data

First word in Response Area		Function	Reference
+3	+2		
0040	1000	Gets the specified processing unit data.	page A-60
0040	4050	Gets the conditions set for data logging.	page A-67
0040	4060	Gets the parallel DI terminal offset data that is set.	page A-67

#### • Commands to Write Data

First word in Response Area		Function	Reference
+3	+2		
0050	1000	Sets the specified unit data.	page A-68
0050	4050	Sets the data logging conditions.	page A-73
0050	4060	Sets the parallel DI terminal offset data.	page A-75

#### 2-4-15 Command Response Processing

About control command response processing, the following timing chart describes the ON/OFF timing of signals related to commands to be input.

#### Timing Chart for Command Execution

The Command Request (EXE) signal is used as the trigger to input and execute various commands such as measurement execution stored in advance in the PLC memory.

The Command Completion (FLG) signal turns ON when execution of the control command is completed. Use this as the trigger to turn OFF the Command Request (EXE) signal.

\*1: A timeout error will occur if you do not turn off the Command Execution (EXE) signal within 10 seconds after the Command Completion (FLG) signal is turned ON. Command Completion (FLG) signal and BUSY signal will be forcefully turned OFF.

- \*2: Busy (BUSY) signal is automatically switched ON to OFF when the command execution is completed.
- (1) The PLC sets the command code and command parameters.
- (2) After checking that the BUSY signal and the Command Completion (FLG) signal have turned OFF, the PLC turns ON the Command Request (EXE) signal again to instruct the Sensor Controller to perform it.
- (3) When receiving the instruction the Sensor Controller performs the command and turns ON the ACK signal and the BUSY signal.
- (4) When completing the execution, the Sensor Controller sets the command code, response code, and response data.

The Command Completion (FLG) signal is turned ON.

(5) The PLC (user) turns OFF the Command Request (EXE) signal when the Command Completion (FLG) signal turns ON.

(6) When detecting that the Command Request (EXE) signal is OFF, the Sensor Controller automatically turns OFF the Command Reception (ACK) signal and the Command Completion (FLG) signal automatically.

#### Continuous Measurement Command (Without handshaking)

Continuous execution is used to repeatedly execute measurement by starting the next measurement operation (image input and measurement processing) as soon as single measurement operation (image input and measurement processing) is completed.

Continuous measurement is started when the Start Continuous Measurements command is executed and ended when the End Continuous Measurements command is executed.

- \*1: A timeout error will occur if you do not turn off the Command Execution (EXE) signal within 10 seconds after the Command Completion (FLG) signal is turned ON. Command Completion (FLG) signal and BUSY signal will be forcefully turned OFF.
- \*2: Busy (BUSY) signal is automatically switched ON to OFF when the command execution is completed.

#### <Operation to Start Continuous Measurements>

- (1) The PLC (user) sets the Start Continuous Measurements command code.
- (2) After checking that the BUSY signal and the Command Completion (FLG) signal have turned OFF, the PLC turns ON the Command Request (EXE) signal again to instruct the Sensor Controller to perform it.
- (3) When completing the preparations for continuous measurement, the Sensor Controller sets the command code and response code. when preparations for continuous measurement have been completed.
- (4) The Command Completion (FLG) signal is turned ON.
- (5) The PLC (user) turns OFF the Command Request (EXE) signal when the Command Completion (FLG) signal turns ON.

- (6) After detecting that the Command Request (EXE) signal has turned OFF, the Sensor Controller starts continuous measureent and turns ON the Command Reception (ACK) signal and the BUSY signal.
- (7) The Command Completion (FLG) signal is automatically turned OFF.

#### <Operation to End Continuous Measurement>

- (8) The PLC (user) sets the End Continuous Measurements command code during execution of continuous measurement by the Start Continuous Measurements command.
- (9) The Command Request (EXE) signal is then turned ON and the instruction is sent to the Sensor Controller.

#### Additional Information

Continuous measurement is not ended in the middle of measurement. When the End Continuous Measurements command was executed, continuous measurement is ended after the measurement in execution was completed.

#### <Ending Continuous Measurement>

- (10) When receiving the instruction, the Sensor Controller stops continuous measurement and turns OFF the BUSY signal.
- (11) After setting the command code and response code, the Sensor Controller turns ON the Command Completion (FLG) signal.
- (12) When detecting that the Command Completion (FLG) signal turns ON, the PLC (user) turns OFF the Command Request (EXE) signal.
- (13) After detecting that the Command Request (EXE) signal has turned OFF, the Sensor Controller automatically turns OFF Command Completion (FLG) signal.

#### **Precautions for Correct Use**

- The measurement during continuous measurement is given priority. Therefore, display of the measurement results (total judgment, images, judgment for each processing unit in the flow display, and detailed results) may sometimes not be updated.
- When continuous measurement is ended, the measurement results from the last measurement will be displayed.

#### Performing Measurement with the STEP Signal

In addition to inputting and executing the Command Request (EXE) as a trigger, the Measurement Trigger Execute (STEP) signal can be used to perform measurement.

- (1) While the ACK signal is OFF, measurement starts by the rising edge of the Measurement Trigger Execute (STEP) signal.
- (2) The starting measurement turns ON the ACK signal.
- (3) The Measurement Trigger Execute (STEP) signal is turned OFF when the ACK signal turns ON.
- (4) The Overall Judgement (OR) signal is output when measurement is completed.
- (5) The ACK signal is turned OFF when the measurement flow is completed.

#### 2-4-16 Data Output

This section describes the ON/OFF timing for signals related to measurement data output after measurement completion using the following timing chart.

\*1, \*2: Data is output at the set output period\*1 and for the set output time.\*2

After the data is output, the GATE signal is turned ON and the data is held for the data output time.

- (1) The Sensor Controller outputs data when the Fieldbus Data Output Unit starts execution.
- (2) Data is output each time that the Fieldbus Data Output Unit is performed for the second time or other Fieldbus Data Output Unit is performed. In that time, the output data for the first time is overwritten.

#### **Precautions for Correct Use**

- To receive all the output data, set *Output control* to *Handshaking*, and then output data. For details, refer to *Setting the PROFINET Output Specifications* on page 2-270, and *Output Format (Fieldbus Data Output)* on page 2-215)
- If any part of data is missing on the PLC side, or the GATE signal is not output from the Sensor Controller of the FH series, set *Measurement priority* to *Lower the priority of the measurement process.*. Note that the measurement time becomes longer with this setting. For details, refer to *Setting the Status at Startup [Startup Settings]* in the *Vision System FH/FHV Series User's Manual (Cat. No. Z365)*.

#### • With handshaking

The Result Completion (GATE) signal switches from OFF to ON when the PLC (user) switches the Result Set Request (DSA) signal from OFF to ON.

At that time, data that is possible to output will be output.\*1

The PLC (user) switches the DSA signal from ON to OFF under the conditions whether it has received the output data and the Result Completion (GATE) signal has been turned ON. In the case where multiple Fieldbus Data Output Units perform the data output, the PLC (user) turns the Data Output Request (DSA) signal ON again to instruct it to output the following data, when the Sensor Controller switched the Data Output Completion (GATE) signal from ON to OFF.

\*1: Data prepared for output which an Output Unit has been already performed in the measurement flow.

\*1 A timeout error will occur if any of the following states continues for longer than the timeout time that is set in the EtherNet/IP settings.

If the DSA signal is not turned ON after a certain time elapses from when the Output Unit was executed. (Turn ON the DSA signal at the same time as the measurement trigger command.)

• If the DSA signal is not turned OFF after a certain time elapses from when the GATE signal turns ON.

- (1) The PLC (user) turns ON the Command Request (EXE) signal and the Data Output Request (DSA) signal at the same time. The output data for the first Fieldbus Data Output Unit can be surely received.
- (2) The Sensor Controller performs the Fieldbus Data Output Unit in the measurement flow. Since the Data Output Request (DSA) signal is ON after the data is written, the Data Output Completion (GATE) signal becomes ON.
- (3) The PLC (user) reads the data when the Result Completion (GATE) signal turns ON and it turns OFF the Result Set Request (DSA) signal.
- (4) The Sensor Controller automatically turns OFF the Result Completion (GATE) signal when it detects that the Result Set Request (DSA) signal has turned OFF.
- (5) If there is more than one Fieldbus Data Output Unit in the measurement flow, the PLC (user) turns ON the Data Output Request (DSA) signal when the Data Output Completion (GATE) signal turns OFF, and then it waits for execution of the next Fieldbus Data Output Unit.
- (6) When the next Fieldbus Data Output Unit is executed, the GATE signal turns ON and the data is output. Receive the second output data and then repeat steps 3 to 5, above. Repeat steps 3 to 5 for any other data outputs.

## 2-4-17 Timing Chart

This section describes the ON/OFF timing for signals related to the sequence of operation from control command input until measurement data output after measurement completion using the following timing chart.

#### • Example 1: Inputting a Measurement Trigger after Switching a Scene without Handshaking

\*1: A timeout error will occur if you do not turn off the Command Execution (EXE) signal from Sensor Controller (master) within 10 seconds. Then Command Completion (FLG) signal and Busy (BUSY) signal will be forced to turn off.

\*2: Busy (BUSY) signal is automatically switched ON to OFF when the command execution is completed.

- (1) The PLC sets the command code and command parameters for the Switch Scene.
- (2) Next, confirm that the BUSY signal and the Command Completion (FLG) signal have turned OFF and then turn ON the Command Request (EXE) signal. A request is sent to the Sensor Controller.
- (3) The Sensor Controller turns ON the Command Reception (ACK) signal and BUSY signal and switches the scene when the request is received.
- (4) The Command Completion (FLG) signal is turned ON when the scene switching is completed.
- (5) The PLC (user) turns the Command Request (EXE) signal OFF when the Command Completion (FLG) signal is switched from OFF to ON.
- (6) After detecting that the Command Request (EXE) signal has turned OFF, the Sensor Controller automatically turns OFF the Command Reception (ACK) signal and Command Completion (FLG) signal.
- (7) The measurement command code and command parameters are set from the PLC.
- (8) The Command Request (EXE) signal is turned ON to execute the measurement command.

#### **Additional Information**

To execute a measurement trigger after changing the scene, first confirm that the Command Completion (FLG) signal and the BUSY signal that turned ON for execution of the Select Scene command have turned OFF.

Also, if the BUSY signal is ON for too little time and the external device cannot read it, increase the time that the BUSY signal is ON for changing scenes so that the external device can read the ON state. To do this, change the *Add time* setting for the *Scene switch time*. Refer to *Setting the Conditions That Are Related to Operation during Measurement* in the *Vision System FH/FHV Series User's Manual (Cat. No. Z365)*.

- (9) The Sensor Controller turns ON the Command Reception (ACK) signal and BUSY signal and performs measurement processing when the request is received.
- (10) The Command Completion (FLG) signal is turned ON when the measurement processing was completed.
- (11) The PLC (user) turns the Command Request (EXE) signal OFF when the Command Completion (FLG) signal turns ON.
- (12) When the Sensor Controller detects that the Command Request (EXE) signal is OFF, it automatically turns OFF the Command Reception (ACK) signal and Command Execution Completion (FLG) signal.

#### Example 2: Outputting Data with more than One Output Unit Without Handshaking

- \*1: A timeout error will occur if you do not turn off the Command Execution (EXE) signal from Sensor Controller (master) within 10 seconds. Then Command Completion (FLG) signal and Busy (BUSY) signal will be forced to turn off.
- \*2: Busy (BUSY) signal is automatically switched ON to OFF when the command execution is completed.
- (1) The measurement command code and command parameters are set from the PLC.

2-4-17 Timing Char

- (2) Next, confirm that the BUSY signal and the Command Completion (FLG) signal have turned OFF and then turn ON the Command Request (EXE) signal. A request is sent to the Sensor Controller.
- (3) The Sensor Controller turns ON the BUSY signal and executes measurement processing when the request is received.
- (4) When the first Fieldbus Data Output Unit in the measurement flow is executed, the Sensor Controller outputs data for the first Fieldbus Data Output Unit to the Data Output Area.
- (5) The Sensor Controller turns the Data Output Completion (GATE) signal ON when the data is output to the Data Output Area.
- (6) The Sensor Controller turns the Data Output Completion (GATE) signal OFF after the time set at the **Output time** in the PROFINET settings has passed.
- (7) The second Fieldbus Data Output Unit in the measurement flow is executed.
- (8) The Sensor Controller outputs the data for the second Fieldbus Data Output Unit to the Data Output Area after the time set at the **Output period** in the PROFINET settings has passed. At that time, the data for the first Fieldbus Data Output Unit is overwritten.
- (9) The Sensor Controller turns the Data Output Completion (GATE) signal OFF after the time set at the **Output time** in the PROFINET settings has passed.
- (10) The Command Completion (FLG) signal is turned ON when the measurement processing was completed.
- (11) The PLC (user) turns the Command Request (EXE) signal OFF when the Command Completion (FLG) signal turns ON.
- (12) When the Sensor Controller detects that the Command Request (EXE) signal is OFF, it automatically turns OFF the Command Reception (ACK) signal and Command Execution Completion (FLG) signal.

#### Additional Information

#### Saving All of the Measurement Results

If you output data from more than one Data Output Unit or for repeatedly measured output data (e.g., for continuous measurements), the same Data Output Area will be overwritten. To save all of the output data, adjust the *Output period* and *Output time* that are set in the

EtherCAT settings so that all of the output data is output and either receive all of the output data by using the Result Notification signal or use handshaking control.

Handshaking lets you control data output by using the Result Notification signal turning ON as a trigger for the data output timing and turning ON the Result Set Request to read the output data.

Each time that data is output (from the second output on), read the output data and move it to a different part of I/O memory in the PLC.

For more information on handshaking, refer to *Data Output Control with Handshaking* on page 1-25.

You can compare the received number of output data and the number of measurements for continuous measurements to check if all of the measurement results have been received.

- Use the following method to check the number of measurements that was actually executed. • Application Example
  - Set a calculation to count the number of measurements that are executed in the measurement flow.

If you set something like [DO+1], each time a measurement is executed (each time the measurement flow is executed), 1 will be added to DO, so the present value of DO will give you the actual number of measurements.

## A Timeout Error Occurred

Problem	Cause	Action
A handshaking timeout error occur- red.	<ul> <li>The timing to switch the DSA signal is too slow.</li> <li>The following patterns are considered.</li> <li>The DSA signal is not turned ON even after measurement has been completed.</li> <li>The DSA signal is not switched from ON to OFF even after the GATE signal has been turned ON.</li> <li>The DSA signal is not turned ON even after the GATE signal has been turned ON even after the GATE signal has been turned OFF.</li> </ul>	After the measurement command is performed, turn the Data Output Request (DSA) signal ON and OFF within the timeout time set in the PROFINET communication set- tings. Or, increase the <i>Timeout time</i> set in the PROFINET settings.

Problem	Cause	Action
A timeout error for the IO controller	The watchdog in the IO controller	Increase the value set at the Up-
occurred and the connection was	operated and a timeout error occur-	date Rate of the IO controller or
disconnected.	red.	make the value for Watchdog
	The Sensor Controller prioritizes	Factor and Data Hold Factor to
	measurement processing and con-	large respectively.
	trol processing over communication	
	processing.	
	Therefore, as the result of the com-	
	munication processing delayed due	
	to the heavy loads of the internal	
	processing, communications be-	
	tween an external device and the	
	Sensor Controller may be tempora-	
	rily interrupted and a communica-	
	tion error may occur.	

## **Slow Operation**

Problem	Cause	Action
Response and data output is slow.	You try to use a wrong combination for communication protocols, like a combination of PLC Link and PRO- FINET.	Use a proper combination of com- munication protocols.

## Settings are not kept

Problem	Cause	Action	
Settings such as Fieldbus Data	Changed the communication set-	Set the Fieldbus Data Output after	
Output calculations and comments	tings after setting the Fieldbus Data	performing the communication	
are not kept.	Output.	module settings.	

# Communications between the Sensor Controller and External Devices are not Correctly Done.

Problem	Cause	Action
The Sensor Controller cannot com- municate with an external device such as a PLC properly. (Only for Ethernet)	The communication settings such as IP address have been changed after the Device information storage tool was performed. (The IP ad- dresses for external devices on the network may have overlapped the IP addresses stored in the Sensor Controller.)	Check that the communication set- tings such as IP address are cor- rect. ( <b>Tool</b> menu - <b>System setting</b> - <b>Communication - Ethernet</b> ) Per- form the Device information storage tool again. The communication set- tings in the software will be copied in the Sensor Controller.

## **Missing of data Occurs**

Problem	Cause	Action
Missing of data occurs. Data Output Completion (GATE) signal and BUSY signal are not out- put from the Sensor Controller.	Since the measurement load on the Sensor Controller becomes heavy, the communication processing for EtherNet/IP is delayed.	Setting Measurement priority to Lower the priority of the measurement process can ease up. Note that the measurement time will delay. For details, refer to Setting the Sta- tus at Startup Startup Settings in the Vision System FH/FHV Series User's Manual (Cat. No. Z365)

2-5-1 Communications Processing Flow

## 2-5 Non-procedure Communications

This section provides the communications settings, communications specifications, input formats, and other information required to perform Non-procedure (normal) communications between the Sensor Controller and an external device.

## 2-5-1 Communications Processing Flow

The Sensor Controller communicates with an external device using command-based Non-procedure communications via Ethernet or RS-232C/422.

In Ethernet, UDP/IP or TCP/IP protocol is used for the communications.

\*1 : If *Xon/Xoff* is selected for the *flow control* and no response is received from the computer within the set timeout interval, there must either be a disconnection or the computer is not functioning correctly, causing the communications to time out.

#### 2-5-2 **Communications Setup Procedures**

4. Communications test

The following settings are required to use Non-procedure.

If communications are not working properly, check the communications setup from step 2 and perform a communications test to determine whether the Sensor Controller can be detected on the network. If that does not solve the problem, refer to the troubleshooting

section for each communication protocol. For details, refer to 2-5-7 Testing Communications on page 2-335.

#### 2-5-3 **Communications Module Settings (Startup Settings)**

The communication method used for communication with the Sensor Controller is selected from the communication modules.

- 1 On the Main window, click Tool - System Settings to open the system settings.
- 2 On the Multiview Explorer on the left, select System settings - Startup - Startup setting and then click the **Communication** tab.

∃ System Settings	Language Setting	Basic	Communication	Operation mode
⊟- Startup	Language Setting	24010	Communication	operation mode
Startup setting				
⊡-Camera Camera connection	Communication modu	le select —		
Inter-camera setting	Serial(Ethernet)			
Output signal setting ⊟- Communication Parallel	Senal(Eulernei)	Nori	Normal(UDP)	
	Serial(RS-232C/422)	Nor	mal	-
	Parallel			
RS-232C/422(Normal)	i aranci	Star	idard Parallel I/O	<u> </u>
Ethernet(Normal(UDP)) EtherNet/IP	Fieldbus	Ethe	erNet/IP	•
- Other	Remote Operation	ON		-

**3** Select one of the following Communication Modules based on the communication method used to connect with the Sensor Controller and the Unit to be connected, and then click **Apply**.

Communications Module	Description	
Serial (Ethernet)	Performs Non-procedurecommunications through an Ethernet	
	connection.	
Non-procedure (UDP)	Select this Communication Module to communicate with the ex-	
	ternal device using UDP communications.	
Non-procedure (TCP)	Select this Communication Module to communicate with the ex-	
	ternal device using TCP server communications.	
Non-procedure (TCP Client)	Select this Communication Module to communicate with the ex-	
	ternal device as a TCP client.	
Non-procedure (UDP)	Select this Communication Module to communicate with the ex-	
(Fxxx series method)	ternal device through UDP or Fxxx series <sup>*1</sup> communications.	
Serial (RS-232C/422)	Normally select this Communication Module to use Non-proce-	
	dure communications through an RS-232C/422 connection.	
Non-procedure	Normally selected when performing Non-procedure	
Non-procedure	Select this Communication Module to communicate with the ex-	
(Fxxx series method)	ternal device	
	through Fxxx series <sup>*1</sup> communications.	

\*1. With the [Normal (Fxxx series method)] communications method, the OK response timing in relation to MEASURE commands is different from that of the [Normal] communications method. For details, refer to 2-5-9 *Command Formats* on page 2-340.

4 Click **Data save** in the Toolbar.

Data save

- **5** On the Main window, click **Function System restart**.
- 6 Click OK in the System restart dialog box to restart the Sensor Controller. When the Sensor Controller was restarted, the set Communication Module will operate with the default settings.
- Set the IP address and other parameters for external devices such as a PLC.

#### Precautions for Correct Use

After you set the Communication Module, always click **Data save** and then restart the Sensor Controller. If the settings are not saved and the Sensor Controller is not restarted, the new Communication Module settings will not be enabled

#### Additional Information

You can save the Communication Module settings to a file. Use the *System data* or *System + Scene group 0 data* option for *saving settings to a file*. For details, Refer to *Saving Settings Data to the Controller RAM Disk or an External Storage Device* in the *Vision System FH/FHV Series User's Manual (Cat. No. Z365)*. 2

### 2-5-4 Communications Specifications Settings

The communications settings must be set separately for Ethernet and RS-232C communications. If communications cannot be performed even after setting these communications settings, check the settings and the communications status.

For details, refer to 2-5-7 Testing Communications on page 2-335.

#### Precautions for Correct Use

• The settings dialog box for the communication specifications will change depending on the Communication Module that you use.

Before you set the communication specifications, select the Communication Module to use with the Sensor Controller in the startup settings.

For details, refer to 2-5-3 Communications Module Settings (Startup Settings) on page 2-314. After you selected the Communication Module, save the settings to the Sensor Controller and restart it.

If you do not restart the Sensor Controller, the selected Communication Module will not be enabled.

- Use the same communication settings for the Sensor Controller and the external device.
- Do not input signals to Ethernet from an external device while setting the Ethernet system settings.
- If the operation mode is set to *Multi-line Random-trigger Mode*, the Controller address cannot be set for line 1 onward. (The same setting for line 0 is used.)

## **Connecting via Ethernet**

- **1** On the Main window, click **Tool System Settings** to open the system settings.
- In the tree view on the left, select System Settings Communication Ethernet Normal (xyz) ("xyz" depends on the Communication Module).
   The Ethernet view is displayed.
- **3** Set each item.
  - UDP case

Address setting				
<ul> <li>Obtain an IP address automatic</li> </ul>	allv

#### Additional Information

- Sensor Controllers of the FH-1000/2000/3000/5000 series with four or eight Camera inputs have two Ethernet ports.
  - Set the settings for the two Ethernet ports as follows:
  - Communication Module Settings: Use the same settings for both ports
  - IP Address Setting:
    - Set a different IP address for each Ethernet port.

The IP address for the top Ethernet port is set in *Address setting*, and the IP address for the bottom Ethernet port is set in *Address setting 2*. Note that the FH prioritizes the bottom port, so when there is a high network load, communication on the top port may be delayed or in some cases communication data may be lost. By using both Ethernet ports simultaneously, you can use the bottom port for PLC Link, Non-procedure, EtherNet/IP, or PROFINET communications with a PLC and the top port for FTP or remote operation communications with an external device.

- The following Sensor Controller type has one Ethernet port:
- FH-L/FHV series
- FH-1000/3000 series with two camera inputs
- In this case, the IP address of the Ethernet port is set in Address setting 2

Setting item	Setting value [Factory default]	Description
Address Settings Address Settings is only for the FH-1000 series (4- and 8-camer ies, FH-3000 series (4- and 8-ca series	a types), FH-2000 ser-	Set the IP address for the upper Ethernet port on the Sensor Controller.

Setting item	Setting value [Factory default]	Description	
	<ul> <li>Obtain an IP ad- dress automatically.</li> <li>[Use the following IP address]</li> </ul>	Set the IP address for the Sensor Controller When Obtain an IP address automatically is selected, the IP address of the Sensor Con- troller will be automatically obtained. When Use the following IP address is select ed, set the IP address, subnet mask, and the default gateway address.	
IP Address	a.b.c.d a: 1 to 223 b: 0 to 255 c: 0 to 255 d: 0 to 254 [10.5.5.100]	Enter the IP address for the Sensor Control- ler.	
Subnet mask	0.0.0.0 to 255.255.255.255 [255.255.255.0]	Enter the subnet mask address.	
Default gateway	a.b.c.d a: 1 to 223 b: 0 to 255 c: 0 to 255 d: 0 to 255 [10.5.5.100]	Enter the default gateway address.	
DNS server	a.b.c.d a: 1 to 223 b: 0 to 255 c: 0 to 255 d: 0 to 255 [10.5.5.100]	Enter the DNS server address.	
Preferred WINS server	a.b.c.d a: 1 to 223 b: 0 to 255 c: 0 to 255 d: 0 to 255 d: 0 to 255 [0.0.0.0]	Enter the WINS server address.	
Alternate WINS server	a.b.c.d a: 1 to 223 b: 0 to 255 c: 0 to 255 d: 0 to 255 d: 0 to 255 [0.0.0.0]	Enter the WINS server address.	

Setting item	Setting value [Factory default]	Description
Address Settings 2 Address Settings is only for the FH-1000 series (2-camera type) FH-3000 series (2-camera type) series	, FH-2000 series,	Set the IP address for the lower Ethernet port on the Sensor Controller.

Setting item	Setting value [Factory default]	Description	
	<ul> <li>Obtain an IP ad- dress automatically.</li> <li>[Use the following IP address]</li> </ul>		
IP Address	a.b.c.d a: 1 to 223 b: 0 to 255 c: 0 to 255 d: 0 to 255 d: 0 to 254 [10.5.6.100]		
Subnet mask	0.0.0.0 to 255.255.255.255 [255.255.255.0]	Same as "Address Settings".	
Default gateway	a.b.c.d a: 1 to 223 b: 0 to 255 c: 0 to 255 d: 0 to 255 d: 0 to 255 [10.5.6.100]		
DNS server	a.b.c.d a: 1 to 223 b: 0 to 255 c: 0 to 255 d: 0 to 255 [10.5.6.100]		
Preferred WINS server	a.b.c.d a: 1 to 223 b: 0 to 255 c: 0 to 255 d: 0 to 255 [0.0.0.0]	Enter the WINS server address.	
Alternate WINS server	a.b.c.d a: 1 to 223 b: 0 to 255 c: 0 to 255 d: 0 to 255 d: 0 to 255 [0.0.0.0]	Enter the WINS server address.	

**4** Click **Apply** to finish the settings.

Click Close to close the System Settings dialog.

#### Precautions for Correct Use

Change the IP address and subnet mask for [Address setting] and [Address setting 2] as required so that each designate a different network address. If the same network address is specified, communications may not be performed correctly.

## Connecting via RS-232C

#### Additional Information

- Input signals cannot be handled during setting of communications specifications. However, the input status can be checked with **Confirmation**.
- For details, refer to 2-5-7 Testing Communications on page 2-335.
- Data output via serial communications is suspended while communications specifications are being set.
- **1** On the Main window, click **Tool System Settings** to open the system settings.
- 2 From the tree view on the left, select **System Settings** and then select **Communication** -**RS-232C/422 (Normal)** or **RS-232C/422 (Normal (Fxxx series method))** The RS-232C window is displayed.
- **3** Set each item..

Setting	Confirmation	
Mode :		Normal
Interface :		RS-232C
Baud rate	[bps] :	38400
Data lengt	h [bit] :	8
Parity :		None
Stop bit [bi	t] :	1
Flow contr	ol :	None
Delimiter :		CR
Timeout (s	]:	5

Setting item	Set value [Factory default]	Description
Interface	<ul> <li>[RS-232C]</li> <li>RS-422<sup>*1</sup></li> </ul>	Align the communication specifications with the external de- vice.
Baud rate [bps] <sup>*2</sup>	<ul> <li>2400</li> <li>4800</li> <li>9600</li> <li>19200</li> <li>[38400]</li> <li>57600</li> <li>115200</li> </ul>	Align the communication specifications with the external de- vice.

Setting item	Set value [Factory default]	Description	
Data length [bit]	• 7 • [8]		
parity	<ul><li> [None]</li><li> Odd</li><li> Even</li></ul>	Align the communication specifications with the external de- vice.	
Stop bit [bit]	• [1] • 2		
Flow control	• [None] • Xon • Xoff	None: The software does not perform the flow control. If the time in which there is no response from external devices reaches the timeout setting time, a timeout error occurs and an error message is displayed in the window. Moreover, the parallel interface ERROR signal turns ON. Xon/Xoff: The software performs the flow control. Data is transmitted according to the Xon/Xoff codes from external devices.	
Timeout [s]	• 1 to 120 [5]	Set the time in which a timeout error will occur.	
Delimiter	• [CR] • LF • CR+LF	Align the communication specifications with the external device.	

\*1. RS-422 cannot be used with the MELSEC-Q series and the FH-series.

\*2. If a baud rate of **38400bps** or higher is selected, effective communications may not be possible depending on the cable length because speeds of over 20 Kbps are not defined in RS-232C standards. In this case, set the baud rate to **19200bps** or lower.

- **4** Click **Apply** to finish the settings.
- **5** Click **Close** to close the System Settings dialog box.

#### 2-5-5 Output Data Settings (Processing Item Registration)

Use the following procedures to set the items to output and the output format for the non-procedure protocol.

This processing item is not available in the FHV series. When you set output data in the FHV series, refer to 2-5-6 Output Data Settings (Numerical Values/Character Strings) on page 2-327.

#### **Additional Information**

When outputting characters read by a processing item such as Barcode, these settings are set in the processing item used to read the characters (Character Inspection, Barcode, or 2DCode). Refer to the descriptions for each processing item for details on the character output settings and output format. (Reference Manual (Cat. No. Z341).)

- Character Inspection
- Refer to Character Inspection in the Vision System FH/FHV Series Processing Items • Barcode
- Refer to *Barcode* in the *Vision System FH/FHV Series Processing Items* • 2DCode
- Refer to 2DCode in the Vision System FH/FHV Series Processing Items • OCR
- Refer to OCR in the Vision System FH/FHV Series Processing Items

## **Registering Processing Items**

Register the processing items for data output in the measurement flow.

**1** Select the **Data Output** processing item in the processing item tree.

## 2 Click Append.

The Data Output processing item is added at the bottom of the unit list (flow).

N <u>e</u>	0.Camera Image Input
å	1.Search
	2.Data Output

3 Click *Data Output* I icon and set the data output items and data format. For details of the settings, refer to the following. *Registering the Items To Output* on page 2-322

#### Additional Information

Data is output in the order that data output is registered in the measurement flow, i.e., the timing is different for each data output processing item. (Data output is executed in the order that it is executed in the measurement flow.) For details, refer to *Outputting the Measurement Data* on page 1-18

## **Registering the Items To Output**

Set the output data with expressions.

Up to 8 expressions from 0 to 7 can be set in each unit. 1 Click

Click Data Output icon in the measurement unit list (flow).

In the Item tab area, click **Setting**.

**3** In the list, click the output data number to set the expression.

.Fieldbus Data Ou	ut	
Setting	Output format	
Output data	nt Expression	
No. 0 Comment: [ Expression : Result: 0	Comment view	_

The selected output data number is displayed under the list.

...

4

Click mext to the expression text box and set the expression.

Specify the processing items, measurement results, and measurement data in the expression. Arithmetic or function calculations can be applied to the measurement data to output. For details of the calculation settings, refer to *Calculation* in the *Vision System FH/FHV Series Processing Items Reference Manual (Cat. No. Z341).* 

- 5 Click for the Comment text box and enter the description for the expression. The entered comment will be displayed in the detailed results area on the Main window. For example, *Test* was entered as the comment for the expression 0, *Test* will be displayed instead of *Expression 0* in the detailed results areas on the Main window.
- **6** Repeat step 3 to 5 to set expressions for all of the required output data numbers.

#### Additional Information

If you delete one of the expressions that is set for output data 0 through 7, the output numbers for all expressions after the deleted expression will stay the same. However, the actual data output will be output as though the list has been shifted forward for the number of expressions that have been deleted.

## **Output Format (Data Output)**

- 1 Click Data Output icon in the measurement unit list (flow).
- 2 In the item tab area, click **Output format**.
- **3** In the Output Setting Area, select the communication method.

Output Setting		
Communication method :		
• RS-232C/RS-422	C Ethernet	
Format setting :		
Output form :	ASCII	C Binary

Setting item	Setting value [Factory default]	Description	
Communication	[RS-232C/RS-422]	Communications are performed via the RS-232C/RS-422	
method		connection.	
method	Ethernet	Communications are performed via the Ethernet connection.	

**4** Select the output format in **Format setting**.

( <sup>Outpu</sup>	t Setting				
Communication method :					
•	RS-232C/RS-422	C Etherne	et		
Format setting :					
	Output form :	ASCII	C Binary		
Digits of integer :			10 💌 Digits		
	Digits of decimal :		4 💌 Digits		

Setting item Setting value [Factory default] Description	
	Outputs ASCII text.
	For details, refer to
[ASCII]	Character Code Table in the Vision System FH/FHV/FZ5
	Series User's Manual (Cat. No. Z365).
Binary	Outputs binary data. Measurement values are multiplied by 1,000 and output is continuous with 4 bytes per data item.
	[Factory default]

#### • When the ASCII Output Format Is Selected

When ASCII is set as the output format, set the following format settings.

When *Binary* is set as the output format, no settings are needed.

Outpu	it Setting	
Comm	unication method :	
	RS-232C/RS-422	C Ethernet
i	Format setting :	
	Output form :	⊙ ASCII ⊂ Binary

## 2-5-6 Output Data Settings (Numerical Values/Character Strings)

## **Registering Processing Items**

Register the processing items for data output in the measurement flow.

- 1 In the Main window, click **Edit flow** in the Toolbar.
- 2 Select **Result output (Message)** from the processing item tree.

## 3 Click Append.

The **Result output (Message)** is appended at the bottom of the unit list (flow).

	0.Camera Image Input FH
Ä	1.Search
	2.Advanced filter
123,ABC	3.Result output (Message)
	4.

4 Click the icon a of **Result output (Message)** in the unit list (flow) or **Set** to set the output device and the output data.

## Setting the Output Device

Here, set a communication method when data is output.

1 Click the icon a of **Result output (Message)** in the unit list (flow) or **Set** to set the output device.

The Result output (Message) setting window is displayed.

🚡 2. Resu	ılt output (Message)				- C	) ×
Outp	outsetting					
No.	Data Type	Data	Value	Title		
0						
	v Insert	Delete Edit				
					0	Byte
			^			^
			~			~
				ОК		Cancel

#### 2 Click Output setting.

The Output setting window is displayed.

Output setting	
Output device :	Not output ~
	Output data to the file
	File name :
	Add a header when creating a file
Character code:	0 When using language dependent characters, please specify the code page according to that language.
Delimiter string:	
Termination string:	OK Cancel

**3** Click at the right side of the **Output device** text box to select the communication method to use.

#### 2 Methods for Connecting and Communicating with External Devices

Output device :	Not output ~
	Not output
	Serial(Ethernet)
	Serial(RS-232C/422)
	Eile name i

**4** Select whether or not to output data to a file (data logging).

Output data to the file		
File name :		
Add a header wh	en creating a file	

Check the box for *Output data to the file* and click [...] on the right side of the **File name** text box to start File Explorer. Select a directory or folder to save the file and enter the file name. (Supported file format is only CSV.)

Contents entered in **Title** on the "Output data editing" dialog in the **Output data** tab will be inserted in the first line of logged data when checking the checkbox for *Add a header when creating a file*".

#### **Additional Information**

- Data is not output when test measurements are executed in TDM editor.
- When *Not output* is selected in *Output device*, no data is output. However, *Output data to the file* has been checked, the data logging is executed.
- When the *serial output* is selected in *Double Speed Multi-input mode*, a queuing processing for communications is executed.
   The communication processing for the later executed process gets into a waiting state until the previously started process finishes its output.

5 Specify Character code, Delimiter string, and Termination string.

Character code:	0	When using language dependent characters, please specify th that language.	ne code page acco	ording to
Delimiter string:				
Termination string:	-		ок	Cancel

· Character code: Specify the following code page for each language.

Language	Code page	Language	Code page	Language	Code page
Japanese	932	English	1252	Chinese (simplified)	936
German	1252	French	1252	Chinese (traditional)	950
Italian	1252	Spanish	1252	Korean	949
Vietnamese	1258	Polish	1250		

- The default 0 is no language-dependent letters in ANSI code page.
- For **Delimiter string** and **Termination string**, the following escape sequence codes are also available.

\n: Carriage return, \r: Line feed, \t: Tab, \r\n: Carriage return line feed

## Setting the Output Data

Set the data to output such as processing item data or fixed character strings.

1 In the item tab area, click **Output data**.

The setting window for **Result output I/O** is displayed.

a) Setting data display area

Display the No. (Output number), Offset (indicating the byte position from the beginning), Data type (Integer, Double, String), Data, Value, and Title (Data description). A value is displayed when a variable is assigned to data.

b) Output data display area

Output data display area Data to output is displayed as readable characters.

c) Button

Button	Description					
	Moves the selected data up one position.					
•	Moves the selected data down one position.					
Insert	Adds new data to the selected data position.					
Delete	Deletes the selected data. The following data moves up after the deletion.					
Edit	Edits the selected data.					
ОК	Saves the current settings and returns to the previous view.					
Cancel	Discards the current settings and returns to the previous view.					

d) Binary data display area

Contents in the output data display area in binary (Hex) are displayed in this area.

2 In the list, select the output data number to set the output and then click **Insert**. The following **Output data editing** dialog box is displayed.

Output data editing				
Data Type	Data		Title	-
	teger : 10	<ul> <li>Fill with 0</li> <li>8</li> </ul>	String setting String length:  Auto	O Fixed
			ок	Cancel

s	etting item	Setting value [Factory default]	Description		
Data type		<ul><li>Number</li><li>String</li></ul>	Set the data type; Number or String		
Data		-	<ul> <li>There are two input methods. Setting the Output Data on page 2-330</li> <li>Enter strings directly</li> <li>Assign variables</li> </ul>		
Title		-	Enters the description for data. In the case where the Title has set and <i>Add a header when creating a file</i> is checked, contents entered in <i>Title</i> on the <i>Output data editing</i> dialog in the <i>Output data</i> are inserted in the first line of logged data when creating a csv file.		
Num	neric setting		This item is valid when <i>Number</i> is selected in <i>Data Type</i> ". <i>Output data</i>		
	Digits of inte- ger	[10]	Sets the number of digits for integer.		
	Digits of deci- mal	[4]	Set the number of digits for under decimal.		
	0 suppress	<ul><li> [Fill with space]</li><li> Fill with 0</li></ul>	When the number of digits set is bigger than that of input da- ta, fill the set character here to the rest of the set digits.		
	Minus	• [-] • 8	Set display format for negative numbers.		
Strir	ng settings		Valid when String is selected in the Data type.		
	String length	<ul><li> [Auto]</li><li> Fixed</li></ul>	Select the format for <i>String length</i> . In <i>Auto</i> , the length is automatically set according to entered string length.		
	Size	0 to 4095 [10]	Set the number of characters when <i>Fixed</i> is selected in <i>String length</i> .		
	Character alignment	<ul><li> [Left]</li><li> Right</li></ul>	Set the display format in the <i>Size</i> when <i>Fixed</i> is selected in <i>String length</i> .		

**3** Click at the right side of the **Data type** text box to select the data to output. *Number* or *String* can be selected.

<ul> <li>Entered data is converted into strings according to specified Digits of integer, Digits of decimal, 0 suppress, and Minus.</li> <li>The number of total digits (integer + decimal) is 15. If it exceeds 15 digits the output data becomes "#ER". When the number of digits set is bigger than that of input data, the character set in 0 suppress fills the rest of the set digits.</li> <li>When a string variable is selected for the data, a convertible character string such as digits that can be converted into numerical values will be converted for output. Moreover, they are handled as 0 if they are not convertible, e.g. AAA.</li> <li>Entered data is set based on String length, Size, and Character alignment".</li> <li>The number of characters that can be entered is 4,095 maximum.</li> </ul>
• Entered data is set based on String length, Size, and Character alignment".
<ul> <li>If exceeding this limit, three overflow characters, "", are appended in the end of the string, the output will be 4,092 characters + "".</li> <li>When <i>Auto</i> is set in String length, the length of an entered string is automatically set to String length.</li> <li>When <i>Fixed</i> is set in String length, the value set in Size is used for the string length.</li> <li>Entered data is displayed at right-justify or left-justify according to the setting in Character alignment.</li> <li>Example: Entered string: "ABCDE", Size: 3</li> <li>Right-justify: "CDE" is output.</li> <li>When NULL is included in the entered character string, the character string following NULL is not output.</li> <li>The following escape sequence codes can be entered. The entered escape sequence codes are handled as fixed character strings.</li> </ul>
<ul> <li>Enter</li> <li>Char</li> <li>Exan</li> <li>Right</li> <li>Left-j</li> <li>When</li> <li>Iowin</li> <li>The f</li> </ul>

4 Enter data, number or string, to **Data** text box.

Directly enter a variable name (Scene variable: SC.~) or specify a variable in Variable

assignment window displayed by clicking Mar.

- When directly entering a variable name, enclose it with " ", e.g. "SC.AA&".
- When a fixed string, e.g. AA, is entered before a variable, the followed variable is handled as a fixed string.
  - Example: AA+SC.AA&  $\rightarrow$  "AA+SC.AA&"
- When "String" is selected in the "Data type" but "Integer" or "Double" is set to the variable, then the variable is converted to a string and then output.

Variable assignment	È			
Variable assignment	t:SC.CCC\$			
	Y			
Variable name	Туре	Туре	Comment	1
Do not assign				
SC.AAA&	Scene	Integer		
SC.BBB#	Scene	Double		
sc.cccs	Scene	String		
SC.DDD&(0)	Scene	Integer array		
SC.EEE#(0)	Scene	Double array		
SC.FFF\$(0)	Scene	String array		
SY.MOJIRETSU\$	System	String		
SY.SYSTEM_A&	System	Integer		
SY.SYSTEM_B&	System	Integer		
SY.SYSTEM_C&	System	Integer		
SY.SYSTEM_D&	System	Integer		
Array element				
			ОК Саг	ncel

- **5** Enter *Title* that indicates the content of output data.
- **6** When *Number* is selected in **Data type**, the following "Numeric setting" area also needs to be set.

Numeric setting		
Digits of integer :	10	
Digits of decimal :	4	
0 suppress :	Fill with space	O Fill with 0
Minus :	• -	08

7 When *String* is selected in *Data type*, the following items in *String setting* area also needs to be set.

ſ	String setting		
	String length:	Auto	◯ Fixed
	Size :		10
	Character alignment:	<ul> <li>Left</li> </ul>	<ul> <li>Right</li> </ul>
ļ			

Example:

👩 2. Re	sult output (Message)				_		×
Ou	tputsetting						
No. 0 1 2 3	Data Type String Number Number	Data SC.CCC\$ SC.AAA& SC.BBB#	Value FH/FH-XXX 0 155.000000		Title System Information Judge Measurent value Y		
<b></b>	Insert	Delete Edit				39 Byt	e
FH/FH	-XXX 0.0000		0000000 0000010 0000020	46 48 2f 46 48 2d 58 58 58 58 20 20 20 30 2e 30 30 30 30	20 20 20 20 20 20		<b>^</b>
-					ок	Cance	el

8 Click **OK** in the end of entering data to close the settings.

2-5-7 Testing Communications

## 2-5-7 Testing Communications

You can check whether the Normal(UDP) communications settings are correct.

If communications cannot be performed even after set up the communications, use the following procedure to check the settings and the communications status.

When checking the communication settings, stop the program on the PLC.

## **Ethernet Communications**

#### • Before Performing a Communications Test

This example assumes that *Normal (UDP) in the Serial(Ethernet)* is selected as the Communication Module.

When checking the communication settings, stop the program on the PLC.

#### • Checking the Communications Settings

Use the following procedures to check whether or not the communication settings are correct.

					1.	On the Main Window, select [Tool] -
Address setting						[System Settings].
Obtain an IP address automatic	ally					In the tree view on the left, select
Use the following IP address						[System Settings] – [Communication] –
IP address:	10 _	5 _	5	100		[Ethernet Normal (xyz)]. ("xyz" depends
Subnet mask:	255 _	255	255	0		on the Communications Module.)
Default gateway:	10 _	5 _	5	100		
DNS server:	10 _	5	5	100	2.	Set the IP address of the Sensor
Preferred WINS server :	0 _	0	0 _	0		Controller.
Alternate WINS server :	0 _	0	0	0		The default settings are as follows: Address setting: 10.5.5.100
Address setting 2				)		Address setting 2: 10.5.6.100
O Obtain an IP address automatic	ally					
Use the following IP address						
IP address:	10 _	5 _	6	100		
Subnet mask:	255 _	255	255	0		
Default gateway:	10 _	5	6	100		
DNS server:	10 _	5 _	6	100		
Preferred WINS server :	0_	0	0	0	3.	Set the IP address of the PLC or other
Alternate WINS server :	0_	0	0	0		external device in [Output IP address].
Input/Output setting					4.	Set the port numbers to use for data I/O
Input mode :	Normal					with the PLC or other external device in
Input form :	ASCII					[Input port No.] and [Output port No.].
Output IP address :	0_	0	0	0		Set the same number as the number for
Input port No. :	9600 -					the PLC or other external device.
Output port No. :	-1 – (-1:Sa	me number Inj	put port No)			
					5.	This completes the Controller settings.

#### • Checking the Communications Status

Use the ping command to check whether or not the Sensor Controller exists on the Ethernet network.

With it, check that the Sensor Controller IP address has been correctly set and is correctly connected to the Ethernet network.

#### Additional Information

The ping command uses the ICMP protocol to send a response request to a device connected through an Ethernet network and determines the time required to respond to that request. If you properly receive a response from the destination device, the network connection and network settings are correctly set.

**1** Connect the Sensor Controller and a computer with an Ethernet cable.

Set the high-order digits of the computer IP address to the same values as the Sensor Controller and the low-order one digit to a different value.

#### <IP Address Setting Example>

Device	Example
Sensor Controller	10.5.5.100 (default)
Computer	10.5.5.101

**2** Open the Windows command prompt on the computer and perform the ping command. At the > prompt, type *ping*, followed by a space and the Sensor Controller IP address, and then press *Enter*.

Example: C:\>ping 10.5.5.100

**3** After a few seconds, *Reply from* followed by the IP address of the Sensor Controller (e.g., 10.5.5.100) are displayed, it means that the Sensor Controller is connected to the Ethernet network properly.

Example: Reply from 10.5.5.100: byte=32 Time<1 ms TTL=128

If anything other than *Reply from* is displayed:

The Sensor Controller is not connected to the Ethernet network for some reason. Check the following.

- Are the high-order three digits of the IP addresses for the computer and the Sensor Controller the same?
- · Is the Ethernet cable correctly connected?

**4** Use the ping command to check the communication status of the PLC as well. After you have confirmed the communication status as described above, transmit a measurement command to the Sensor Controller in practice to check the communication operations as the Vision Sensor.

## **RS-232C/422** Communications

## Before Performing a Communications Test

This example assumes that Serial (RS-232C/422) - Normal or Normal (Fxxx series method) is selected as the Communications Module.

When checking the communication settings, stop the program on the PLC.

## Checking the Communication Settings

Use the following procedures to check whether or not the communication settings are correct.

If character strings were not sent or received, check the following:

- Ares the communication settings correct for the connected device?
- · Is the cable connected?
- · Are all cables wired correctly?

After you have confirmed the communication status as described above, send an actual measurement command to the Controller and check to confirm that Vision Sensor communications are operating correctly.

## 2-5-8 Output Items

## Measurement Results That You Can Output with the Data Output Processing Item

The following data can be output using the processing items related to the Result Output. Measurement values are also referred using processing units such as expressions.

Measurement items	Character string	Description
Judgment	JG	Judgment result
Data 0 to 7	D000 to D007	Results of expressions set for output data 0 to 7.

## **External Reference Table for the Data Output Processing Item**

By specifying a number, the following data can be referenced from control commands or processing items that have a set/get unit data function.

Number	Data name	Set/Get	Data range
0	Judgment	Get only	0: No judgment (unmeasured) 1: Judgment result OK −1: Judgment result NG
136	Communications method	Set/Get	0: Ethernet 1: RS-232C/RS-422
137	Output format	Set/Get	0: ASCII 1: Binary
138	Digits of integer	Set/Get	1 to 10
139	Digits of decimal	Set/Get	0: 0 to 4: 4
140	Minus	Set/Get	0: -, 1: 8
141	Field separator	Set/Get	0: OFF, 1: Comma, 2: Tab, 3: Space 4: Delimiter
142	Record separator	Set/Get	0: OFF, 1: Comma, 2: Tab, 3: Space 4: Delimiter
143	0 suppress	Set/Get	0: No, 1: Yes
144 to 147	Output IP Address 1 to 4 (only when <i>Ethernet</i> is selected for the communications method)	Set/Get	Destination IP addresses
149	Output IP Address Setting (only when <i>Ethernet</i> is selected for the communications method)	Set/Get	0: Reference to system, 1: Individual specifica- tion
150	Output form (decimal)	Set/Get	0: Fixed point, 1: Floating point
151	Offset	Set/Get	0 to 99999
152	Number of output data items (PLC Link communications only)	Set/Get	8 to 256
153	Plus	Set/Get	0: No, 1: +
1000 to 1002	Data 0 to Data 7	Get only	<ul> <li>ASCII: -99999999999999999999999999999999</li> <li>Binary: -2147483.648 to 2147483.647</li> </ul>

#### **Additional Information**

If you are using external reference numbers 5 to 12 on an FZ4 or earlier model, use 1000 to 1007 on the FH/FHV.

## 2-5-9 Command Formats

This section describes the format of commands to be used in Non-procedure communicaitons.

#### **Precautions for Correct Use**

Japanese characters cannot be used. To load a scene or other data, set the file name with alphanumeric characters in advance.

## An Input Format Example

#### • When the parameter is a numeric

Example: Get the display status with IMAGEDISPCOND. <Command Format>

1	Ι	Μ	А	G	Е	D	Ι	S	Ρ	0	Ν	D		C R	
		-	-			-				S	pac	e –		]	Nυ

Number of the Image Pane (Maximum number of line is 2.)

Enter a delimiter at the end of commands. In this manual, delimiters are expressed with  $|C_R|$ . Separate parameters with spaces (Not required before delimiters).

#### **Precautions for Correct Use**

When connected via Ethernet (UDP), a Delimiter is not necessary in the command. Also, note that there are no Delimiters for responses. Make sure to enter a Delimiter when the other communication protocols are used. Also, note that there are delimiters for responses.

#### <Response Format>

The command was processed correctly:

Acquired data 0: Through 1: Freeze or Freeze and Last NG are mixed. 2: Last NG

Only OK is returned when there is no data, such as Scene switch, to get.

<Response Format>

The command was not correctly processed:

ER is returned at the following cases:

- · When a command which does not exist was specified.
- When the number of parameters is not correct.
- When the specified parameter range is not correct.
- · When the contents of the specified parameter are not correct.
- When the specified operation did not correctly terminate.

## Additional Information

In Ethernet, when the acquired data and the OK response are continuous, those are transmitted as a separate packet.

#### When a parameter is a character string

The character string must be enclosed with double quotation marks.

Example: Save Scene with SCENESAVE command.

<Command Format>

SCNSAVE		0		"	C\Data\RAMDisk\ABC.SCN	"	C R
---------	--	---	--	---	------------------------	---	--------

Example: Set the prefix of a Logging file name to *Undefined* with SYSDATA command. <Command Format>

SYSDATA	Logging	imageLoggingHeader		"	"	C R
---------	---------	--------------------	--	---	---	--------

## OK Response in Non-procedure Communications (Fxxx series method)

The OK response for [Normal (Fxxx series method)] communications is compatible with the communications method for  $F\square\square\square$  series Vision Sensors.

The timing of the OK response when the Sensor Controller receives a MEASURE command with the [Normal (Fxxx series method)] communications method is the same as the timing for an  $F\square\square\square$  series Vision Sensor.

For details, refer to 2-5-3 Communications Module Settings (Startup Settings) on page 2-314.

Non-procedure Communications

Non-procedure Communications (Fxxx-series Method)

## 2-5-10 Command List

This section explains the input format for each command used for serial Non-procedure (normal) communications. Commands are input with ASCII text. Both lowercase and uppercase letters can be used. For details of commands, refer to *A-1-5 Non-procedure Command Details* on page A-85.

#### • Execution Commands

Command	Abbrevia- tion	Function	Reference
BRUNCHSTART	BFU	Branches to the start of the measurement flow (processing unit 0).	page A-88
CLRMEAS	None	Clears all measurement result values.	page A-88
CPYSCENE	CSD	Copies the scene data.	page A-89
DATASAVE	None	Saves the current system data and scene group data in the Sensor Controller.	page A-94
DELSCENE	DSD	Deletes the scene data.	page A-97
ECHO	EEC	Returns an entered text string without changing it.	page A-102
IMAGEFIT	EIF	Returns the display position and display magnifi- cation to their default values.	page A-109
IMAGESCROLL	EIS	Shifts the image display position by the specified amount.	page A-115
IMAGEZOOM	EIZ	Zooms the image display in or out by the specified factor.	page A-120
	М	Performs measurement one time.	page A-131
MEASURE		Performs continuous measurement.	page A-131
		Ends continuous measurements.	page A-132
MEASUREUNIT	MTU	Performs test measurement for the specified unit.	page A-133
MOVSCENE	MSD	Moves the scene data.	page A-134
DECIMACE		Registers the specified image data as a registered image.	none A 110
REGIMAGE	RID	Loads the specified registered image as the meas- urement image.	page A-148
RESET	None	Restarts the Sensor Controller.	page A-150
TIMER	TMR	Executes the specified command string after a specified delay.	page A-168
UPDATEMODEL	UMD	Registers the model again.	page A-171
USERACCOUNT	UAD	Adds a user account to a specified group ID. Deletes a specified user account.	page A-172

#### • Commands to Get Status

Command	Abbrevia- tion	Function	Reference
DIPORTCOND	DPC	Gets the ON/OFF status of all parallel DI termi- nals.	page A-100
IMAGEDISPCOND	IDC	Gets the image mode for the specified image display window.	page A-107

2-5-10 Command List

Command	Abbrevia- tion	Function	Reference
IMAGESUBNO	ISN	Gets the sub-image number that is currently dis- played in the specified image display window.	page A-116
IMAGEUNITNO	IUN	Gets the number of the Unit that is currently dis- played in the specified image display window.	page A-118
INPUTTRANSSTATE	ITS	Gets the input status (prohibited/permitted) for the Communications Modules.	page A-123
LAYOUTNO	DLN	Gets the number of the layout that is currently displayed.	page A-126
LOGINACCOUNT	LAI	Gets the user name for the user account currently logged in.	page A-128
LOGINAC- COUNTGROUP	LAG	Gets the group ID for the account currently logged in.	page A-130
OPELOGCOND	OLC	Gets the current state of the operation log.	page A-135
OUTPUTTRANS- STATE	OTS	Gets the output status (prohibited/permitted) to an external device.	page A-136
PARAALLCOND	PAC	Gets the ON/OFF status of all parallel terminals except for DI terminals.	page A-138
PARAPORTCOND	PPC	Gets the ON/OFF status of all parallel DI termi- nals.	page A-143
SCENE	S	Gets the current scene group number.	page A-151
SCNGROUP	SG	Gets the current scene group number.	page A-155

## • Commands to Set Status

Command	Abbrevia- tion	Function	Reference
DOPORTCOND	DPC	Sets the ON/OFF status of all parallel DO termi- nals.	page A-101
IMAGEDISPCOND	IDC	Sets the image mode for the specified image display window.	page A-107
IMAGESUBNO	ISN	Gets the sub-image number that is currently dis- played in the specified image display window.	page A-116
IMAGEUNITNO	IUN	Sets the number of the Unit to display in the speci- fied image display window.	page A-118
INPUTTRANSSTATE	ITS	Permits/prohibits inputs to the Communications Modules.	page A-123
LAYOUTNO	DLN	Sets the layout number and switches the image.	page A-126
LOGINACCOUNT	LAI	Switches the currently logged in account.	page A-128
OPELOGCOND	OLC	Sets the state of the operation log.	page A-135
OUTPUTTRANS- STATE	OTS	Permits/prohibits outputs to external devices.	page A-136
PARAALLCOND	PAC	Sets the ON/OFF status of all parallel terminals except for DO terminals.	page A-138
PARAPORTCOND	PPC	Sets the ON/OFF status of the specified parallel I/O terminal.	page A-143
SCENE	S	Switches to the specified scene number.	page A-151
SCNGROUP	SG	Switches to the scene group with the specified number.	page A-155

## • Commands to Read Data

Command	Abbrevia- tion	Function	Reference
DATALOGCOND	DLC	Gets the conditions set for data logging.	page A-90
DATALOGFOLDER	DLF	Gets the data logging folder name.	page A-92
DATE	None	Gets the date and time.	page A-95
DIOFFSET	DIO	Gets the parallel DI terminal offset data that is set.	page A-98
IMAGECAPTURE- FOLDER	ICF	Gets the screen capture folder name.	page A-105
IMAGELOGFOLDER	ILF	Gets the image logging folder name.	page A-111
IMAGELOGHEADER	ILH	Gets the prefix for the file name in which logged images are saved.	page A-113
SYSDATA	None	Gets settings related to image logging.	page A-162
UNITDATA	UD	Gets the specified processing unit data.	page A-169
VERGET	None	Gets the Sensor Controller version information.	page A-174

## • Commands to Write Data

Command	Abbrevia- tion	Function	Reference
DATALOGCOND	DLC	Sets the data logging conditions.	page A-90
DATALOGFOLDER	DLF	Sets the name for the data logging folder.	page A-92
DATE	None	Sets the date and time.	page A-95
DIOFFSET	DIO	Sets the parallel DI terminal offset data.	page A-98
IMAGECAPTURE- FOLDER	ICF	Sets the name for the screen capture folder.	page A-105
IMAGELOGFOLDER	ILF	Sets the name for the image logging folder.	page A-111
IMAGELOGHEADER	ILH	Sets the prefix for the file name in which logged images are saved.	page A-113
SYSDATA	None	Changes the settings related to image logging.	page A-162
UNITDATA	UD	Sets the specified unit data.	page A-169

## • File Load Commands

Command	Abbrevia- tion	Function	Reference
BKDLOAD	None	Loads the system + scene group 0 data.	page A-86
SCNLOAD	None	Loads the scene data.	page A-157
SGRLOAD	None	Loads the scene group data.	page A-159
SYSLOAD	None	Loads the system data.	page A-165

## • File Save Commands

Command	Abbrevia- tion	Function	Reference
ALLIMAGESAVE	AIS	Saves all image data in the Sensor Controller's memory with ifz format in external storage.	page A-85
BKDSAVE	None	Saves the system + scene group 0 data that is currently used by the Sensor Controller in a file.	page A-87
IMAGECAPTURE	EIC	Captures the screen.	page A-103
IMGSAVE	None	Saves the image data stored in the the Sensor Controller's memory.	page A-121
LASTIMAGESAVE	LIS	Saves the last logging image.	page A-125
SCNSAVE	None	Saves the scene data.	page A-158
SGRSAVE	None	Saves the scene group data.	page A-160
SYSSAVE	None	Saves the system data.	page A-166

## 2-5-11 Output Format

When the processing unit *Data Output* is placed in a scene, measurement results are sequentially output starting from the smallest data number set in **Setting** of *Data Output*. You can also place more than one Data Output Unit in the measurement flow. You can then use record separators to identify the data for individual Data Output Units.

For details, refer to Output Format (Data Output) on page 2-324.

## **Outputting ASCII Data**

Set the output format as *ASCII* in *Output form* of the *Data Output* processing item. The default setting is *ASCII*.

## • Output Format

Data 0 measurement value	,	Data 1 measurement value	,	 Data 7 measurement value	CF

#### Additional Information

The output format, number of digits, data separator, etc., can be changed as necessary. For details, refer to 2-5-5 Output Data Settings (Processing Item Registration) on page 2-321

Example: Integer digits: "5 digits", decimal places: "3 digits", negative numbers: -, field separator: *comma*, record separator: *delimiter*.

#### Additional Information

- Field separators are not output if there is no following data.
- · Lower decimal digits of the data are rounded off and then the data is output.

The range of values that can be output is as follows:

When measurement value < -999999999999999, "-99999999999999" is output.

When measurement value > 999999999999999, "99999999999999" is output.

When JG (Judgement) is set, the following values are output.

OK: 1

NG: -1

#### Additional Information

After the measurement was completed, the measured data is continuously output until all the data is output. Note that the output cannot be interrupted.

2-5-11 Output Format

#### 2 Methods for Connecting and Communicating with External Devices

# Outputting Binary Data Set the output format as Binary in Output form of the Data Output processing item.

## Output Format

Measured value x 1000 of Data 0	Measured value x 1000 of Data 1	Measured value x 1000 of Data 7
4 bytes	4 bytes	4 bytes

The measurement data is multiplied by 1000 and output is continuous with 4 bytes per data item. Negative numbers are output in 2's complement format.

For details of 2's Complement, refer to Definitions of Basic Terms in the Vision System FH/FHV Series User's Manual (Cat. No.Z365).

Example: When Data 0 is 256.324, and data 1 is -1.0000.

\$00	\$03	\$E9	\$44	П	\$FF	\$FF	\$FC	\$18
Dat	a 0: 256 (2	324 256.324	x 1000)		Data	a 1: -1000 (-1	) .000 x 10	000)

#### Additional Information

Unlike ASCII output, binary output has no separators between data, such as field separators or record separators. For details, refer to *Output Format (Data Output)* on page 2-324

The range of values that can be output is as follows:  $-2147483.648 \le Measurement value \le 2147483.647$ When measurement value < -2147483.648, -2147483.648 is output. When measurement value > 2147483.647, 2147483.647 is output. When JG (Judgement) is set, the following values are output. OK: 1000 (1 × 1000) NG: -1000 (-1 × 1000)

#### **Additional Information**

After the measurement was completed, the measured data is continuously output until all the data is output. Note that the output cannot be interrupted.

## 2-5-12 Non-procedure Communications Troubleshooting

Problem	Cause	Action
	The wiring is incorrect.	Check the wiring. Check the cable connections.
	There is a problem with the com- munication specification settings.	Make sure that the settings are cor- rect.
No response is received after send- ing communication commands.	Communications has not been es- tablished just after the Sensor Con- troller start-up. (It requires more time to establish the communica- tions.)	Check whether or not the communi- cations are available between the Sensor Controller and external de- vices after the Sensor Controller turned on. <sup>*1</sup> Then start communications and measurement for ordinary opera- tions.
	Commands are sent while the BUSY signal is ON.	Send commands while the BUSY signal is OFF.
No response is received after send-	A cable is broken.	Check the cable connections.
ing communications commands. (Communications were properly working previously.)	A connector has been disconnect- ed.	Check the connector connections.
	The Sensor Controller is in Edit Mode.	Change it to RUN or ADJUST Mode.

## Cannot Input to the Sensor Controller

\*1. Commands to get status such as SCENE command allow you to confirm availability of communications between the Sensor Controller and external devices.

After starting up the Sensor Controller, send commands to get status from external devices to the Sensor Controller. When the Sensor Controller returns correct responses to external devices, no problem in communications between them are confirmed.

## No Data Is Output from the Sensor Controller

Problem	Cause	Action
No data is output at all.	The output IP address is incorrect. (Ethernet communications only)	Set the output IP address correctly.
	The wiring is incorrect or a cable is broken.	Check the wiring. Check the cable.
	A connector has been disconnect- ed.	Check the connector connections.
	You have not placed any Data Out- put processing items in the meas- urement flow.	Place Data Output processing items in the measurement flow.
	The <i>Output</i> option is not selected in the Adjustment window.	Place a check to the <i>Output</i> option in the Adjustment window.
	The target output device for the Da- ta Output Unit is incorrect.	Make sure that the setting is cor- rect.

Problem	Cause	Action
	Communications has not been es- tablished just after the Sensor Con- troller start-up. (It requires more time to establish the communica- tions.)	Check whether or not the communi- cations are available between the Sensor Controller and external de- vices after the Sensor Controller turned on. <sup>*1</sup> Then start communications and measurement for ordinary opera- tions.
Data is sometimes output and	A cable is broken or there is a con- nection problem.(RS-232C/422 communications only)	Check the cable connections.
sometimes not.	The measurement commands are not being received. (Ethernet com- munications only)	Check to confirm that an OK re- sponse is being returned after sending a measurement command.
Output is unstable.	There is no terminating resistance. (Ethernet communications only)	Output stability may be improved by adding terminating resistance in RS-422 communications.

\*1. Commands to get status such as SCENE command allow you to confirm availability of communications between the Sensor Controller and external devices.

After starting up the Sensor Controller, send commands to get status from external devices to the Sensor Controller. When the Sensor Controller returns *OK* responses to external devices, no problem in communications between them are confirmed.

## **Slow Operation**

Problem	Cause	Action
Response and data output is slow.	The baud rate is too low for the amount of data to be transferred.	Increase the baud rate for commu- nications or use a different commu- nications method.

# Communications Between the Sensor Controller and External Devices are not Correctly Done (EtherNet only)

Problem	Cause	Action	
The Sensor Controller cannot com- municate with an external device such as a PLC properly. (Only for Ethernet)	The communication settings such as IP address have been changed after the Device information storage tool was performed. (The IP ad- dresses for external devices on the network may have overlapped the IP addresses stored in the Sensor Controller.)	Check that the communication set- tings such as IP address are cor- rect. ( <b>Tool</b> menu - <b>System setting</b> - <b>Communication - Ethernet</b> ) Per- form the Device information storage tool again. The communication set- tings in the software will be copied in the Sensor Controller.	

## Communications Fail just After Start-up of the Sensor Controller

Problem	Cause	Action
The Sensor Controller does not re-	Communications are not establish-	After confirming that communica-
spond even serial commands are	ed just after start-up of the Sensor	tions are available between the
sent to it just after its start-up.	Controller. (To establish communi-	Sensor Controller and external de-
No data is output from the Sensor	cations between the Sensor Con-	vices after startup of it, send serial
Controller just after its start-up.	troller and external devices takes	commands and start measurement.
	time.)	

#### Additional Information

Commands to get status such as SCENE command allow you to confirm availability of communications between the Sensor Controller and external devices.

After starting up the Sensor Controller, send commands to get status from external devices to the Sensor Controller.

When the Sensor Controller returns correct responses to external devices, no problem in communications between them are confirmed.

## 2-6 Parallel Communications

This section describes the communication settings, communication specifications, input/output format, and communication timing chart required for parallel communications between the Sensor Controller and external devices.

## 2-6-1 Communications Processing Flow

The Sensor Controller communicates with external devices via a parallel interface.

## I/O Signals and Data for Communicating with External Devices

This section describes the basic connections and signal flow with external devices.

## Inputs

You can input the following signals to the Sensor Controller while the Main window is displayed.

#### Measurement Trigger (STEP signal)

Measurement is performed once when STEP signal turns ON. (Single Measurement)

#### Command Input (DI0 to DI7 Signals)

You can send commands and control the Sensor Controller by turning the DI0 to DI7 signals ON and OFF. For details of Sensor Controller control commands, refer to 2-6-10 Command Formats on page 2-391.

#### Precautions for Correct Use

Note that if DI7 is ON after the command is executed, the command will be executed repeatedly. For details, refer to *DI0 to DI7 (Command Execution) Timing* on page 2-386 *Multi-line Random-trigger Mode* 

## Outputs

Each time measurement is performed, the measurement results are output. The following measurement results can be output:

Overall Judgement (OR signal)

The results of more than one processing item are judged.

The overall judgement will be NG if even one of the individual judgement results is NG<sup>\*1</sup>.

\*1 : With the default settings, output is performed even if the overall judgement result is NG, but this can be changed so that output is performed only when the overall judgement result is OK. For details, refer to *Setting the Output Signal Specifications* on page 2-357.

#### Parallel Data Output (DO0 to DO15 Signals)

The measured values of processing items or the calculation results of expressions are output. This processing item can not be used in the FHV series.

#### • Parallel Judgement Output (DO0 to DO15 Signals)

The measured values of the processing items or calculation results are judged and the judgement results are output.

This processing item can not be used in the FHV series.

#### Result output (Parallel I/O)(DO0 to DO15 Signals)

Outputs the measurement value of the processing item and the calculation result of the calculation formula. It is also possible to judge the measurement value or calculation result of the processing item and output the judgment result.

To use this processing item in the FHV series requires that the camera be connected by the Smart Camera Data Unit (Parallel Interface) FHV-SDU10.

#### **Additional Information**

If the operation mode is set to Multi-line Random-trigger mode and the number of lines to use simultaneously was increased, the signal type and details of control and output are different from a single line used as described in the following table.

For the signals that can be used and for differences in assignments, refer to *Multi-line Random-trigger Mode Signal Specifications* on page 2-384.

Number of controlled lines	Differences from when only a single line is used (i.e., when the opera- tion mode is not set to <i>Multi-line Random-trigger Mode</i> )
2 lines	<ul> <li>The usable functions are the same as for when only a single line is used.</li> <li>DO signals are divided as follows: Line 0: DO0 to DO7, Line 1: DO8 to DO15</li> </ul>
3 or 4 lines	<ul> <li>Parallel data output and parallel judgement output cannot be performed (DO signals cannot be used).</li> <li>Handshaking output cannot be used (the GATE signal and DSA signal cannot be used).</li> <li>An encoder cannot be used.</li> </ul>
5 to 8 lines	<ul> <li>The RUN signal cannot be used. The same ERR signal is used for all lines.</li> <li>Parallel data output and parallel judgement output cannot be performed (DO signals cannot be used).</li> <li>Handshaking output cannot be used (the GATE signal and DSA signal cannot be used).</li> <li>An encoder cannot be used.</li> </ul>

FH-1000/2000/3000/5000 series Sensor Controller

## 2-6-2 Communications Setup Procedures

The following settings are required to use Parallel.

## **2-6-3** Communications Module Settings (Startup Settings)

The communication method used for communication with the Sensor Controller is selected from the communication modules.

- **1** On the Main window, click **Tool System Settings** to open the system settings.
- **2** On the Multiview Explorer on the left, select **System settings Startup Startup setting** and then click the **Communication** tab.

System Settings	Language Setting	Basic	Communication	Operation mod
🖻 Startup	Lunguage bearing	Dualt	Communication	operation mou
Startup setting	1 C C C C C C C C C C C C C C C C C C C		16	<i>a</i>
🖻 Camera	0			
- Camera connection	Communication mod	iule select		
Inter-camera setting	Serial(Ethernet)	-	mal(UDP)	100
Utput signal setting	Conditizationitoly	INUT	mai(UDP)	
- Communication	Serial(RS-232C/42	2) Nor	mal	-
- Parallel				
RS-232C/422(Normal(Fxxx series method))	Parallel	Star	Standard Parallel I/O	
Ethernet(Normal(TCP Client))	Fieldbus		erNet/IP	
EtherNet/IP		1 Euro	INCOL	
- Other	Remote Operation	ON		•
Date-time setting		1		
- Fan control setting				

**3** Select one of the following Communication Modules based on the communication method used to connect with the Sensor Controller and the Unit to be connected, and then click **Apply**.

Communications Module		Description	
Parallel		Colort this Communication Medule to nonform Donallel interface	
	StandardParallel I/O	Select this Communication Module to perform Parallel interface.	

## 4 Click **Data save** in the Toolbar.

5

On the Main window, click Function - System restart.

**6** Click **OK** in the System restart dialog box to restart the Sensor Controller. When the Sensor Controller was restarted, the set Communication Module will operate with the default settings.

#### Additional Information

You can save the Communication Module settings to a file. Use the *System data* or *System + Scene group 0 data* option for *saving settings to a file*. For details, Refer to *Saving Settings Data to the Controller RAM Disk or an External Storage Device* in the *Vision System FH/FHV Series User's Manual (Cat. No. Z365)*.

## 2-6-4 Communications Specifications Settings

Set the communications specifications, such as the data output method and data signal operation. If communications cannot be performed even after setting these communications settings, check the settings and the communications status.

For details, refer to 2-6-7 Testing Communications on page 2-376.

#### **Precautions for Correct Use**

- Before you set the communication specifications, select the Communication Module to use with the Sensor Controller in the startup settings.
- For details, refer to 2-6-3 Communications Module Settings (Startup Settings) on page 2-354.
  After you selected the Communication Module, save the settings to the Sensor Controller and restart it.

If you do not restart the Sensor Controller, the selected Communication Module will not be enabled.

#### Additional Information

Input signals cannot be handled during setting of communications specifications. However, the input status can be checked with *Confirmation*.

For details, refer to 2-6-7 Testing Communications on page 2-376.

## Selecting the Output Control Type

You can select how to control the data output timing to synchronize the timing of output with the external device.

## • Types of Output Control

#### None

After measurement was completed, the Sensor Controller outputs the measurement results without synchronizing with the external device.

Since the GATE signal is also output with it, adjust the reading timing for the output results in the external device based on the GATE signal.

- \*1 : Overall judgment (OR) output is output when the measurement is completed, regardless of when the Output Unit was executed.
- \*2 : You can change the settings for time to be turned ON the GATE signal after the measurement data was output and the duration that the GATE signal remains ON. For details, refer to *Communications Specifications Settings* on page 2-360.

#### **Additional Information**

The GATE signal will not be output if there is no data set for parallel judgment output and parallel data output.

If only the OR signal is output, read the OR signal when the BUSY signal turns OFF.

#### • Handshaking

Measurement results are output only after it is determined that the external device can receive data.

Handshaking is effective for sequentially outputting many measurement results, which is a reliable way to transfer data.

For details, refer to Data Output Control with Handshaking on page 1-25.

#### Synchronization Output

The measurement results are output after the STEP signal has turned ON for the number of delays set in *Number of delays*.

The output timing of the measurement results from the Sensor Controller can be offset according to the actual timing of processing on the line.

Example: Sequential Feed Line that Uses a Star Wheel

The discharge timing for when a defective part is found and the measurement results output timing can be synchronized.

#### Additional Information

- As the steps will be counted according to the number of times the STEP signal turns ON while Synchronized output is selected, set that results are output only once for each measurement. (Place only one Output Unit in the measurement flow. In the case of Parallel Judgment Output and Parallel Data Output, either one can be set. In Parallel Data Output, only one output item is allowed.)
- Designate only the STEP signal for measurement trigger input. When a serial command is used for single measurement or continuous measurement, the output timing will not match and this can cause Sensor Controller malfunctions.

## Setting the Output Signal Specifications

You can change the operation of signals output with parallel communications.

## • Changing the Judgement Output ON Conditions (Output Polarity)

The ON conditions for the OR signal and the DO0 to DO15 signals can be set to turn ON the signals when the judgment results are OK or when they are NG. The default setting is *ON at NG*. This setting can be changed by setting the *Output polarity* in the communications specifications. For details, refer to *Communications Specifications Settings* on page 2-360.

### Setting the Timing to Turn OFF the Overall Judgment (OR) signal (Oneshot Output)

You can select from the following two methods for the timing of when the Overall Judgment (OR) signal turns OFF after measurement result confirmation.

This setting can be changed by setting *One-shot OR signal* in the communications specifications. For details, refer to *Communications Specifications Settings* on page 2-360.

#### One-shot Output Disabled (Default)

The OR signal stays ON until the judgment changes.

#### One-shot Output

OR signal output stays ON for a certain amount of time, and then it is turned OFF again. The time to maintain the OR signal output can be specified. (Setting range: 0.1 to 1000.0 [ms])

#### Outputting the STGOUT and SHTOUT Signals

These functions are supported by the FH series Sensor Controllers only. With parallel communications, the STGOUT signal (strobe trigger output) and SHTOUT signal (shutter output) cannot be output at the same time. Select which signal to output based on your needs.

1 On the Main Window, select System Settings – Camera – Output Signal Setting from the Tool menu.

Common setting	
Output signal :	STGOUT

The output signal settings dialog box is displayed.

**2** Select the signal to output in the **Common** area.

Setting item	Setting value [Factory default]	Description
Output signal	<ul><li> [STGOUT]</li><li> SHTOUT</li></ul>	STGOUT sets how to use the signal line. STGOUT: Uses the STGOUT signal line as the STGOUT sig- nal. SHTOUT: Uses the STGOUT signal line as the SHTOUT sig- nal.

#### **Additional Information**

- In Multi-line Random-trigger Mode, this output signal selection can be used to set the output signal for line 0 only. The setting for line 0 will be used for all other lines.
- The STGOUT signal output settings must be set in the *Electronic flash setting* for each Camera Image Input processing item.

## гh

#### **Precautions for Correct Use**

SHTOUT signals output through EtherCAT communications are not affected by this setting.

2-6-4 Communications Specifications Settings

## • SHTOUT Signal Settings: [Output Signal Setting]

These functions are supported by the FH series Sensor Controllers only.

This setting sets the SHTOUT signal that is output when the Camera exposure is completed. By detecting when the exposure is completed using the SHTOUT signal, you can minimize the amount of time that the workpiece must be kept still for imaging and you can move the Camera or workpiece immediately after the exposure is completed.

1 On the Main Window, select System Settings – Camera – Output Signal Setting from the Tool menu.

Common setting	
Output signal :	STGOUT
Line setting	
SHTOUT delay [µs] :	<b>0 &gt;</b>
SHTOUT width [µs] :	5000   < >
SHTOUT polarity :	Positive     O Negative

The output signal settings dialog box is displayed.

2 Set the SHTOUT signal for each line in the *Line settings* area.

Setting item	Setting value [Factory default]	Description
SHTOUT delay [µs]	0 to 1000 [0]	Sets the delay time until the SHTOUT signal turns ON after exposure is completed in 10 [µs] incre- ments.
SHTOUT width [µs]	40 to 10000 [5000]	Sets the SHTOUT signal output time in 10 [µs] in- crements.
SHTOUT polarity	<ul><li> [Positive]</li><li>Negative</li></ul>	Sets the pulse polarity of the SHTOUT signal. Positive: The SHTOUT signal turns ON when ex- posure is completed. Negative: The SHTOUT signal turns OFF when exposure is completed.

**3** Click **Apply**.

#### **Precautions for Correct Use**

- If more than one Camera is connected, the SHTOUT signal will remain ON for the Camera with the longest exposure time.
- You cannot use the Shutter Output (SHTOUT) signal when the image mode is set for *Through image*.
- If you have registered more than one Camera Image Input processing unit in the measurement flow, the SHTOUT signal will be turned ON for each Camera Image Input processing unit individually.
- The SHTOUT signal will be output for as many times as imaging is performed when Camera Image Input HDR or Camera Image Input HDR Lite processing item is used.
- The SHTOUT signal that is output through EtherCAT communications is affected by this setting.

## **Communications Specifications Settings**

Use the following procedure to select the type of output control, set the output signal operation, and set other parallel interface communication specifications.

- **1** On the Main Window, select **Tool System Settings Communication**.
- **2** Select **System Settings Communication Parallel** from the tree view on the left. The Parallel View is displayed.
- **3** Click **Setting** to set the communication specifications.

		Confirmation	Setting
	ON at NG	utput polarity:	Judge ou
\$	ON at error	put polarity:	Error out
	None	ontrol :	Output co
10.0		eriod [ms] :	Output pe
1.0		delay [ms] :	Gate ON
5.0		me [ms] :	Output tin
10.0		[s] :	Timeout (
1		of delay :	Number
		OR signal —	, One-shot
5.0		ne [ms] :	Output tim

4 Set each item.

Setting item	Set value [Factory default]	Description
Judge output polarity <sup>*1</sup>	• ON at OK • [ON at NG]	Sets the polarity of the judgment result output sig- nal. This applies to the Overall Judgement (OR) Signal and Parallel Judgment Output (DO0 to DO15). The Polarity of the Parallel Judgment Output (DO0 to DO15) can also be set for each Parallel Judg- ment Output Processing Unit. For details, refer to <i>Registering Parallel Judgment</i> <i>Output Items</i> on page 2-368. ON at OK: ON when the judgment result is OK. For the overall judgment, ON when all judgment results are OK. ON at NG: ON when the judgment result is NG. For the overall judgment, ON when one of the judgment results is NG.
Error output polarity	<ul> <li>[ON at error]</li> <li>ON when an error oc- curs.</li> </ul>	Sets the polarity of the error output signal. ON at error: ON when an error occurs. OFF at error: OFF when an error occurs.
Output control	<ul> <li>[None]</li> <li>Handshaking</li> <li>Synchronization output</li> </ul>	<ul> <li>When outputting data, set whether or not to synchronize with external equipment.</li> <li>None:</li> <li>The Sensor Controller outputs measurement results without synchronizing with external devices.</li> <li>For details, refer to <i>Output Control: None</i> on page 2-396.</li> <li>Handshaking:</li> <li>The Sensor Controller outputs measurement results with synchronizing with external devices.</li> <li>For details, refer to <i>Output Control: Handshaking</i> on page 2-397.</li> <li>Synchronization output:</li> <li>Measurement results are output while synchronizing with processing timing on the line. The STEP signal is ignored the number of times set in <i>Number of delays</i>, and measurement results are output when the STEP signal turns ON next time.</li> <li>When Through image has been selected, synchronization output control: Synchronization or page 2-399.</li> </ul>

Setting item	Set value [Factory default]	Description
Output period [ms]	2.0 to 5000.0 [10.0]	Valid only when <i>Output control</i> is set to <i>None</i> . Set the cycle by which measurement results are output. Set the timing of the Parallel Judgment Output (DO0 to DO15). Sets the cycle so that the interval is equal to or longer than <i>Gate ON delay</i> + <i>Output time</i> and shorter than measurement interval. If the cycle were longer than the measurement in- terval, output timing will be delayed while meas- urement is being repeated.
Gate ON delay [ms]	1.0 to 1000.0 [1.0]	Sets the time from when results are output to the parallel interface to when the GATE signal turns ON. This is a waiting time until data output is sta- ble. Set this so that it is longer than the external device delay time.
Output time [ms]	1.0 to 1000.0 [5.0]	Valid only when <i>Output control</i> is set to <i>None</i> . Sets the GATE signal ON time. Set the time re- quired for external devices to acquire measure- ment results.
Timeout [s]	0.5 to 120.0 [10.0]	<ul> <li>Valid only when <i>Output control</i> is set to <i>Handshaking</i>.</li> <li>A timeout error occurs when no response from external devices is received at the following timing within the time that has been set.</li> <li>When the DSA signal turns ON after measurements are completed</li> <li>When the DSA signal turns OFF after the GATE signal turns ON</li> <li>When the DSA signal turns ON after the GATE signal turns OFF</li> <li>When signals from DI0 to DI6 and DI7 are used to execute a command, if the time until the DI7 signal turns OFF after the ACK signal turned ON exceeded the set timeout interval.</li> </ul>
Number of delays	1 to 15 [1]	Valid only when the <i>Output control</i> parameter is set to <i>Synchronized output</i> . Sets how many times the STEP signal is ignored until the measured results are output after the STEP signal is tuned ON.

Setting item	Set value [Factory default]	Description
One-shot OR signal	<ul><li>ON</li><li>[OFF]</li><li>Output time</li></ul>	ON: When the judgment output ON condition is satis- fied after the measurement results are finalized, the OR signal is turned ON for the time set at the <i>one-shot output time</i> . It is then turned OFF after the specified time has elapsed. OFF: The judgment is output after measurement results are finalized. the ON/OFF state of the OR signal is held until it is changed by the next measurement result. Output time: Sets the ON time for the OR signal after one-shot was output. (Setting range: 0.1 to 1000.0 [ms])

\*1. For Parallel Judgment Output, you can change the output polarity of each Parallel Judgment Output unit regardless of the value of this setting.

For details, refer to 2-6-5 Output Data Settings (Processing Item Registration) on page 2-364.

#### Precautions for Correct Use

Set the OR one-shot output time in the following range: External device OR signal read period (cycle time) – 1.0 [ms] < OR one-shot output time < Measurement trigger interval(measurement takt time) – 0.5 [ms]

## 5 Click Apply.

The settings are confirmed and the Parallel View closes.

## **2-6-5** Output Data Settings (Processing Item Registration)

Set the data to output with parallel communications.

This processing item is not available in the FHV series. When you set output data in the FHV series, refer to 2-6-6 Output Data Settings (Numerical value/Judgment) on page 2-370.

The following three types of data can be output with parallel communications:

- OR signal
- · Parallel judgment output
- Parallel data output

#### Additional Information

- The OR signal is output automatically, even if no Output Units were set.
- To perform Parallel Judgment Output or Parallel Data Output, you must register an Output Unit in the measurement flow and set the required output details.
- If you control from three to eight lines in *Multi-line Random-trigger Mode*, you cannot use Parallel Judgment Output or Parallel Data Output.

## Data Output by Output Data Type

#### OR Signal

This signal outputs the overall judgment.

You can determine the overall judgment by monitoring the status of the OR signal.

After the measurement results are established, the OR signal will be output automatically when the overall judgment is NG.

You can also set the signal to be output when the overall judgment is OK.

For details, refer to Setting the Output Signal Specifications on page 2-357.

#### Additional Information

The overall judgment gives the results of more than one processing item. As a result, the overall judgment will be NG if even one of the individual judgment results is NG.

#### Parallel Data Output

The measured values of processing items or the calculation results of expressions are output. Data items can be set from data 0 to data 7. Each item is output using the 16 bits from DO0 to DO15.

The data output specifications are as follows:

- · Only integer portion is output. Fractional digits are rounded off.
- The range of values that can be output is as follows: Binary format: -32768 to +32767

BCD format: -999 to +999

If the measurement value is out of range, the actual measurement value is not output and the minimum or maximum value within the range is output instead.

	Data type	Measurement value that is below the possible output range	Measurement value that is above the possible output range
_	Binary	A value of −32768 is output.	A value of +32767 is output.
	BCD	A value of −999 is output.	A value of +999 is output.

#### Additional Information

When the operation mode is set to *Multi-line Random-trigger Mode*, the parallel data output range is between -127 and 127 for binary data, and -9 and 9 for BCD data.

## • Parallel Judgment Output

The measured values of the processing items or calculation results are judged and the judgment results are output.

Judgment results can be set from judgment 0 to judgment 15. Each result is output from DO0 to DO15.

## Setting Up Parallel Data Output

The measured values of processing items or the calculation results of expressions are output.

## • Registering Parallel Output Units

Register the processing items for data output in the measurement flow.

- 1 Click **Edit flow** in the Toolbar.
- 2 Select the **Parallel Data Output** processing item from the processing item tree.

## **3** Click **Append**.

The Parallel Data Output processing item is appended at the bottom of the unit list (flow).

0.Camera Image Input
1.Search
2.Parallel Data Output

#### **Additional Information**

Data is output in the order that Output Units are registered in the measurement flow, i.e., the timing is different for each data output processing unit. (Data output is executed in the order that it is executed in the measurement flow.)

#### Set the items to output

In an expression, set the data to output (i.e., the measured value of a processing item or the calculation results of an expression).

Up to 8 expressions from 0 to 7 can be set in each unit.

Click the Parallel Data Output icon 🕮.

- 2 In the Item tab area, click **Setting**.
- 3
  - In the list, click the output data number to set the expression.

Fieldbus Data Out	put	
Setting	Output format	
	ent Expression	
Comment:		-
Expression :	0000	

The selected output data number is displayed under the list.

**4** Click — next to the expression text box and set the expression.

- - -

Specify the processing items, measurement results, and measurement data in the expression. Arithmetic or function calculations can be applied to the measurement data to output. For details of the calculation settings, refer to *Calculation* in the *Vision System FH/FHV Series Processing Items Reference Manual (Cat. No. Z341).* 

**5** Click for the **Comment** text box and enter the description for the expression. The entered comment will be displayed in the detailed results area on the Main window. For example, *Test* was entered as the comment for the expression 0, *Test* will be displayed instead of *Expression 0* in the detailed results areas on the Main window.

**6** Repeat step 3 to 5 to set expressions for all of the required output data numbers.

#### Additional Information

#### **Output When Multiple Items Are Set**

The items that are set for output data numbers 0 through 7 are output to the PLC reception buffer in ascending order, one data item at a time (16-bit units). Each time a data item is output, the GATE signal turns ON.<sup>\*1</sup>

When this occurs, the first data item that was output to the PLC reception buffer (data 0) is overwritten by the next output data item (data 1).

Therefore, the data output to the PLC reception buffer must be saved to PLC memory each time the GATE signal turns ON for each data item.

\*1: The operation of the DSA signal depends on whether handshaking for output control is enabled.

For details, refer to Data Output Control with Handshaking on page 1-25.

## • Output Format (Parallel Data Output)

- 1 Click the **Parallel Data Output** icon I in the measurement unit list (flow).
- **2** In the item tab area, click **Output format**.
- **3** Select the **output format** in the output settings.

Output setting	
Format :	
e Binary	O BCD

Setting item	Setting value [Factory default]	Description						
	[Binary]	Data is output as 2's complement binary data. Information on 2's Complement: For details, refer to <i>Definitions of Basic Terms</i> in the <i>Vision</i> <i>System FH/FHV Series User's Manual (Cat. No. Z365).</i>						
Output format	BCD	<ul> <li>Data is output expressing 1 digit with 4 bits and expressing a 3-digit integer and sign with 16 bits.</li> <li>Bits 12 to 15 These bits give the sign. (positive: 0000, negative: 1111)</li> <li>Bits 0 to 11 Every 4 bits express 1 digit from ones place (bits 0 to 3: 1st digit) to the hundreds place (bits 8 to 11: 3rd digit).</li> </ul>						

## **Registering Parallel Judgment Output Items**

Use the following procedure to output the judgment results that are set for parallel output.

#### • Registering Parallel Judgment Output Items

Use the following procedure to output the judgment results that are set for parallel output.

- 1 Click Edit flow in the toolbar or on the Main Window.
- 2 Select the **Parallel Judgement Output** processing item from the processing item tree.

## 3 Click Append.

The **Parallel Judgment Output** processing item is appended at the bottom of the unit list (flow).

N.	0.Camera Image Input
Å	1.Search
<u></u>	2.Parallel Judgement Output

#### Additional Information

Data is output in the order that Output Units are registered in the measurement flow, i.e., the timing is different for each data output processing unit. (Data output is executed in the order that it is executed in the measurement flow.)

## • Registering the Items To Output

In an expression, set the target for judgment (i.e., the measured value of a processing item or the calculation result of an expression).

Up to 16 expressions from 0 to 15 can be set in each unit.

Click the **Parallel Judgment Output** icon Market in the measurement unit list (flow).

- 2 In the Item tab area, click **Setting**.
- **3** In the list, click the output data number to set the expression.

Setting Output parameter	
Judgement data	
No. Comment Expression	<b></b>
2 3	
4 5	
6 7	
8 9	
10 11	
12 13	-
No. 0 Comment view	
Comment:	
Expression :	
Result : 0.0000	
Judgement condition : -999999999 9999 999993999	

The selected output data number is displayed under the list.

**4** Click — next to the expression text box and set the expression.

Specify the processing items, measurement results, and measurement data in the expression. Arithmetic or function calculations can be applied to the measurement data to output. For details of the calculation settings, refer to *Calculation* in the *Vision System FH/FHV Series Processing Items Reference Manual (Cat. No. Z341).* 

**5** Click the we button for the judgment condition, and then set the upper and lower limits to judge as OK.

If the result data set in step 4 above is within the range set here, the result will be judged as OK.

Judgement condition :										
-9999999999.9999		999999999.9999								
·										

- **6** Click for the **Comment** text box and enter the description for the expression.
- **7** Repeat steps 4 and 5 to set expressions for all of the required output data numbers.
- Output Parameters (Parallel Judgment Output)
  - 1 Click the **Parallel Judgment Output** icon in the measurement unit list (flow).
  - 2 Click Output parameter in the Item Tab Area.
  - **3** Set the items in the output settings area.

2-6-5 Output Data Settings (Processing Item Registration)

S	Setting item	Setting value [Factory default]	Description
Out	out polarity	<ul><li> [System (paral- lel)]</li><li> Unit</li></ul>	Selects System (parallel) or Unit to set the output polarity.
	System (par- allel)	-	Select when you want to match the output polarity of the evaluation result to the system setting.
	Unit	<ul><li>[ON at NG]</li><li>ON at OK</li></ul>	<ul> <li>Select when you want to set the output polarity of the evaluation result per processing unit.</li> <li>ON at NG: Outputs when the judgment result is NG.</li> <li>ON at OK: Outputs when the judgment result is OK.</li> </ul>

**4** For **Reflect to overall judgment**, select whether to apply this processing unit's evaluation result to the overall evaluation of the scene.

Reflect	to overall	judgement

Setting item	Setting value [Factory default]	Description						
Reflect to overall	• [ON]	Select whether the judgment results of this processing unit is						
judgment	• OFF	reflected in the scene overall judgment.						

## **2-6-6** Output Data Settings (Numerical value/Judgment)

## **Registering Processing Items**

Register the processing items for data output in the measurement flow.

- 1 In the Main window, click **Edit flow** in the Toolbar.
- 2 Select **Result output (Parallel I/O)** from the processing item tree.

3 Click Append.

The Result output (Parallel I/O) is appended at the bottom of the unit list (flow).

•	0.Camera Image Input FH
å	1.Search
ŧ.	2.Advanced filter
1011 0100	3.Result output (Parallel I/ O)

4 Click the icon is of **Result output (Parallel I/O)** in the unit list (flow) or **Set** to set the output data.

## Setting the Output Data

Configure the object to output with the parallel interface. data to output with the parallel I/O in 256 times can be set.

	0	3. Result outpu	t (Parallel I	/ 0)																					×
		Output frequ 1 th time	Data Type	9	Data	I							Т	ītle											
(a)																									
	ļ	<b>A V</b>	Inser		Delet			Edit

																						OI	<	Ca	ncel

- Setting data display area
   Display the waiting number of times until output, Data type (integer or judgment), Data, Title (data description).
- b. Output data display area

Display data to output. Each of 0 to 15 corresponds to the output result for each of DO0 to DO15 terminal. The value is checked with decimal or hex format.

Button	Description	
	Moves the selected data up one position.	
	Moves the selected data down one position.	
Insert	Adds new data to the selected data position.	
Delete	Deletes the selected data. the following data moves up after that.	
Edit	Edits the selected data.	

## 1 Click Insert.

The following Output data editing dialog box is displayed.

Output data editing				
Data Type				
Integer 🗸 🗸				
ОК	Cancel			

2 In the *Output data editing* dialog, set data to output. For each data settings of integer and judgment, refer to *Setting for Integer Output* on page 2-372 and *Setting for Judgment Output* on page 2-373.

**3** Repeat step 1 to 2 for the number of data to output. Clicking data set in the *Setting data display* area emphasizes the corresponding output data on the area.

#### Precautions for Correct Use

ΓM

When the operation mode is set to Multi-line Random-trigger mode, the displayed content on the *Output data display* area differs from the actual signal to be output.

When the number of lines is two, all output status for DO0 to DO15 is displayed on the *Output data display* area. However, the actual data to be output on line 0 is displayed on DO0 to DO7 terminals and output as it is.

Although the actual data to be output on line 1 is also displayed on DO0 to DO7, they are actually output on DO8 to DO15.

## • Setting for Integer Output

1 In the Output data editing dialog, select Integer and then clock OK.

Output data editing					
Data Type					
Integer 🗸					
	ок	Cancel			

#### **2** Specify an integer to output using a variable or direct input.

Title	
- AAS	-
	OK Cancel

Setting item	Setting value [Factory default]	Description
Data	-	Sets data to output.
		<ul><li>The following two setting methods are available.<sup>*1</sup></li><li>Directly enter an integer with a character string.</li><li>Assign a variable.</li></ul>

Setting item	Setting value [Factory default]	Description
Title	-	Sets the description for the set item with character strings. The character strings set here is displayed on the <b>Title</b> col- umn in the <i>Setting data display</i> area. Multilingual input is also available. For details, refer to <i>Inputting Text</i> in the <i>Vision System FH/FHV Series User's</i> <i>Manual</i> (Cat. No. Z365).

\*1. If character strings instead of numeric values or variables are set, the display on the *Output data display* area will not be done properly. Enter a numeric value or variable with alphanumeric properly.

## **Precautions for Correct Use**

- When *data* is a real number, the rounded value will be output.
- If the value of *data* exceeds the range to be expressed with the parallel I/O terminals, the overflowed values will be ignored to output.

## • Setting for Judgment Output

1 In the Output data editing dialog, select Judgment and then click OK.

Output data editing				
Data Type				
Judgment				
OK Cancel				
_				

**2** Specify the output polarity and judgment condition to assign to each terminal of the parallel interface.

upper limit values	[0.0000] to	judged as OK.
	[0.0000]	
Title	-	Sets the description for the set item with character strings. A
		character string set in Bit 0 will be displayed on the Sets the
		description for the set item with character strings.
		Multilingual input is also available. For details, refer to
		Inputting Text in the Vision System FH/FHV Series User's
		Manual (Cat. No. Z365).

\*1. If character strings instead of numeric values or variables are set, the display on the *Output data display* area will not be done properly. Enter a numeric value or variable with alphanumeric properly.

# Settings in TDM Editor

# 巾

### Precautions for Correct Use

If you enter data that does not follow the specified data format using TDM editor, the data will not be properly recognized as data. Therefore, the data will not be displayed on the *Output data display* area or output to external devices.

In the following case, the data type will be judged as improper data. Restart the settings from the data type selection.

- When the data ID (INT or JDG) is not correctly written in the top correctly.
- When a character string other than "0" or "1" is specified at the *Output polarity* in the judgment data.
- When a character string such as alphabet that cannot be converted to numeric values are set in the lower or upper limit value.

## • Setting for Output Data

Sets the following character strings based on the data type of the output data using TDM editor.

- Data type is integer:
  - INT, <data>

Item	Description	
Data	Inputs a numeric value or variable name to output using alphanumeric characters.	

• Data type is judgment:

JDG, <output polarity><new line>

<Data 0>,<lower limit value 0>,<upper limit value 0><new line>

<Data 1>,<lower limit value 1>,<upper limit value 1><new line>

<Data 15>,<lower limit value 15>,<upper limit value 15>

Item	Description
Output polarity	Inputs 0 or 1. • ON at NG:
	0 • ON at OK:
	1

Item	Description
Data 0 to 15	Inputs a numeric value or variable name for the judgment target using alphanumeric characters.
Lower limit value 0 to 15	Specifies a lower limit value with numeric values.
Upper limit value 0 to 15	Specifies a upper limit value with numeric values.
New line	Inputs a new line. For that, CR, LF, or CR+LF is available.

## Additional Information

When you skip a Bit with no setting, just input a new line into it.

## • Setting for Output Data Title

Sets the following character strings based on the data type of the output data using TDM editor.

• Data type is integer:

<Title>

Item	Description	
Title	Inputs a character string for the title.	

<Title>: A character string for the title

- Data type is judgment:
  - <Bit 0 title><new line>
  - <Bit 1 title><new line>

•••

<Bit 15 title>

Item	Description	
Bit 0 to 15 title	Input a character string for the title.	
New line	Inputs a new line. For that, CR, LF, or CR+LF is available.	

# 2-6-7 Testing Communications

Use the following procedures to check the communications status with the external devices connected with a parallel interface. You can check whether wiring and communications settings have been performed correctly.

- **1** On the Main Window, select **Tool System Settings Communication**.
- **2** Select **System Settings Communication Parallel** from the tree view on the left. The Parallel View is displayed.
- **3** Click **Confirmation** to check the I/O status.

Setting	Confirmation	
Input state		
DSA0	STEP1     STEP2     STEP3     STEP4     STEP5     STEP6     STEP7       DSA1	
	2 3 4 5 6 7 DI LINE 0 1 2	

Setting item	View	Description
Input state	STEP0 to STEP7 Only the settings for STEP0 and STEP1 are valid for an Sensor Con- troller of the FZ5-800/1100/1200 ser- ies. DSA0, DSA1 DI0 to DI7 DI LINE0 to DI LINE2 Valid only for an FH-1000/2000/3000/5000 series Sensor Controller.	The input status of each signal from the external device to the Sensor Controller is displayed. When a signal is input, the background color turns into red.
Output state	RUN ERR BUSY OR GATE READY ACK DO0 to DO15	The output status of each signal is displayed. When a signal is output, the background color turns into red. The output status from each signal of the Sensor Controller to external devices can be specified. Changes between ON and OFF and between 0 and 1 can be simulated without performing meas- urement.

**4** Change the contents to be sent.

Outp	ut stai	te —							
F	RUN	OFF	EF	R	OFF	BUS	SY	ON	
C	DR	OFF	GA	TE	OFF	REA	DY	OFF	
A	кск	OFF							
ſ	0	1	2	3	4	5	6	7	)
	OFF	OFF	OFF	OFF	OFF	OFF	OFF	OFF	
	OFF	OFF	OFF	OFF	OFF	OFF	OFF	OFF	
	8	9	10	11	12	13	14	15	

Each time *ON* and *OFF* are switched, the changed contents are displayed on the monitors of external devices. Make sure there are no problems.

٢Þ

### Additional Information

For the FZ5-800/1100/1200 series, DO0 to DO7 of line 1 are assigned to the DO8 to DO15 parallel terminals. Therefore, if you turn ON DO0 to DO7 to test line 1 communications, signals will be output on the DO8 to DO15 parallel terminals.

## Precautions for Correct Use

For the FZ5, the status of the following signals can be checked only on the *Communication confirmation* dialog box for line 0.

- RUN
- ERR
- BUSY

5 Click Close.

# 2-6-8 I/O Signals

The following tables list the signals that are used to control I/O for parallel communications.

0:	0:	E	ON/OFI	F timing
Signal	Signal name	Function	OFF to ON	ON to OFF
STEP	Measurement Trigger Input signal	Input measurement trig- gers from external devi- ces, such as optic switches. Measurement is performed once by synchronizing with the STEP signal rising (OFF to ON). In STEP input, a STEP signal filter (filter initial set value: 100 [µs]) has been set.	Switch from OFF to ON (rising) to perform a measurement.	Switch from ON to OFF when the user (PLC) detected that the Sen- sor Controller of the FH/FHV series turns the BUSY signal ON.
DSA (Used on- ly for hand- shaking output control.)	Data Output Request signal	This is a signal that the user (PLC) requests the FH/FHV to externally output data executed in the measurement flow at handshaking. When this signal turns ON while an Output Unit (Parallel Data Out- put Unit) is executed in the measurement flow, the FH/FHV will output the data of the process- ing item.	Turn ON the signal when the user (PLC) want to output the data externally. Turn the DSA signal ON when the STEP sig- nal is turned ON. If more than one output item is set in a single Output Unit, or if more than one Output Unit is set in the measurement flow, turn the DSA sig- nal ON again when the GATE signal turns OFF for the first data output. For details, refer to 2-6-11 Time Charts on page 2-395.	Turn OFF the signal when the user (PLC) detected that the FH/ FHV turns ON the Re- sult Completion (GATE) signal.
DI0 to DI7	Command In- put signals	Input commands from the external device.	-	-
DILINE0 to DI- LINE2 (Sensor Controllers of the FH-1000/2000/ 3000/5000 ser- ies only)	Command In- put Line Speci- fication signals	Specify the line number when inputting a com- mand from an external device. Available in Multi-line Random-trigger Mode	-	-

Cignol	Circul name	Function	ON/OFF timing		
Signal	Signal name		OFF to ON	ON to OFF	
ENC (Phase A, B, or Z)	Encoder Input (Phase A, B, or Z)	This is the encoder in- put signal. Valid only when <i>Use</i> <i>Encoder trigger</i> is set in the system settings.	-	-	

# **Output Signals**

Qienal	Cianal news	Eurotian	ON/OFF timing		
Signal	Signal name	Function	OFF to ON	ON to OFF	
RUN	Measurement Mode Signal	This signal indicates whether or not the Sen- sor Controller is in RUN mode.	Turn <b>ON</b> when the Sen- sor Controller is in Run Mode, which means that the Sensor Control- ler is in the measurable status and <b>RUN signal</b> <b>output</b> in Layout set- tings is checked.	<ul> <li>The signal turns OFF in either of the following cases:</li> <li>In ADJUST Mode.</li> <li>When the Sensor Controller cannot perform measurement.</li> <li>RUN signal output is unchecked in the current Layout settings.</li> </ul>	
BUSY	Busy signal	<ul> <li>This signal indicates when external inputs such as commands cannot be accepted.</li> <li>Make sure this signal is OFF before you request a command.</li> <li>While this signal is ON, no commands will be accepted even if they are sent.</li> <li>Note:</li> <li>A command received through any other protocol is in execu- tion, which is also de- tectable.</li> <li>ON of this signal does not mean that a command is in exe- cution.</li> </ul>	Turn ON when The Sensor Controller of the FH/FHV series receives a command from the user (PLC). (The signal turns ON after the EXE signal turned ON.)	Turn OFF when the user (PLC) turns OFF the Command Request (EXE) signal.	

Signal	Cignal name	Function	ON/OF	F timing
Signal	Signal name	Function	OFF to ON	ON to OFF
OR	Overall Judg- ment signal	<ul> <li>Output the overall judgment.</li> <li>This is determined</li> <li>when the measurement</li> <li>is completed (BUSY</li> <li>signal ON to OFF).</li> <li>Note:</li> <li>1. The Output polarity</li> <li>setting determines</li> <li>whether this signal</li> <li>turns ON when the</li> <li>judgment result is</li> <li>OK or NG.</li> <li>For details, refer</li> <li>to Setting the Output</li> <li>Signal Specifications on page</li> <li>2-357.</li> <li>2. The OR signal is</li> <li>output only when</li> <li>the Output option is</li> <li>selected in the Adjustment Window.</li> </ul>	Turn ON based on the judgment results when measurement is com- pleted. (i.e., when the BUSY signal turns OFF.)	The status of the OR signal is maintained un- til the next OR signal is output. You can set the one- shot output settings so that the OR signal turns OFF automatically after a set time passed. You can also turn OFF the OR signal by exe- cuting the Clear Parallel OR+DO command.
DO0 to DO15	Data Output signals	These signals output the results for expres- sions set for a <b>Parallel</b> <b>Judgement Output</b> or <b>Parallel Data Output</b> Output Unit.	-	-

2

2-6-8 I/O Signals

Signal	Signal name	Eurotion	ON/OFF timing	
Signal	Signal name	Function	OFF to ON	ON to OFF
GATE	Data Output Completion signal	This signal indicates the timing to load the output data from DO0 to DO15 to the User (PLC Link). This signal is ON, which means that the data is output from the Sensor Controller. The user (PLC) reads the data when this sig- nal turns ON. Depending on the measurement flow set- tings, the GATE output may start while the BUSY signal is ON. Note that the OR signal does not necessarily work together with the GATE signal.	<ul> <li>No Handshaking: Turn ON when the Sensor Controller of the FH/FHV series executes the Output Unit (Parallel Data Output Unit or Paral- lel Judgement Output Unit) in the measure- ment flow<sup>*1</sup> and preparations for data output have been completed.</li> <li>Handshaking: Turn ON when the Sensor Controller of the FH/FHV series executes the Output Unit (Parallel Data Output Unit or Paral- lel Judgement Output Unit) in the measurement flow<sup>*1*2</sup>, the Data Output Request (DSA) signal is ON, and preparations for data output have been completed.</li> <li>*1: This occurs when the Output Unit is executed as the measurement flow is executed in order from the top. It does not occur when exe- cution of a measure- ment is completed.</li> <li>*2: The signal is out- put if a Parallel Judgement Output or Parallel Data Output processing item is set in the measurement flow.</li> </ul>	<ul> <li>No Handshaking: The signal turns OFF after the set <b>output</b> <b>time</b> has elapsed.</li> <li>Handshaking: The signal turns OFF when the user (PLC) turns OFF Data Out- put Request (DSA) signal.</li> </ul>

Signal	Cignel news	Function	ON/OFF timing		
Signal	Signal name	Function	OFF to ON	ON to OFF	
READY	Multi-input Ready signal	This signal indicates when the STEP signal can be input when the multiinput function is used. Turn ON the STEP sig- nal when the READY signal turns ON. When using the Multi- input function, the next STEP signal is accept- ed only after the READY signal turns ON (i.e., when image input has been completed). Note: When you use a Cam- era-mount Lighting Controller, the time re- quired for the READY signal to turn OFF may increase in comparison with not using it. For details, refer to <b>Camera Image Input FH</b> or <b>Camera Image</b> <b>Input HDR</b> in the <i>Vision</i> <i>System FH/FHV Series</i> <i>Processing Items</i> <i>Reference Manual (Cat.</i> <i>No. Z341).</i>	Turn ON when the STEP signal can be in- put.	Turn OFF when the STEP signal cannot be input. Note: When <i>Through image</i> are being displayed, the READY signal will turn OFF, but the STEP sig- nal can be input. Deter- mine whether or not the STEP input is accepta- ble based on the BUSY signal.	

Signal	Signal name	Function	ON/OFI	= timing
Signal	Signal name	Function	OFF to ON	ON to OFF
SHTOUT	Shutter Output signal	<ul> <li>This signal indicates when Camera exposure has been completed.</li> <li>This signal is output on- ly when SHTOUT is se- lected as the output signal settings of the system settings.</li> <li>Note: <ul> <li>If more than one Camera is connect- ed, the signal will re- main ON for the Camera with the lon- gest exposure time.</li> <li>You cannot use the Shutter Output Signal when the image mode is set for <i>Through image</i>.</li> <li>If you have regis- tered more than one Camera Image Input processing unit in the measurement flow, the SHTOUT signal will be turned ON for each Camera Image Input processing unit individually. There- fore, use Camera Switching processing items instead of Camera Image Input processing items in the middle of the</li> </ul> </li> </ul>	After the Camera expo- sure is completed, the signal turns ON after the time set for the <b>SHTOUT delay</b> in the output signal settings has elapsed.	The signal turns OFF after the time set for the SHTOUT width in the output signal settings has elapsed.
STGOUT	Strobe Trigger Output	measurement flow. This is the trigger signal for the strobe.	After an external trigger input is received, the signal turns ON after the time set for the <b>STEP-STGOUT delay</b> in the electronic flash settings has elapsed.	The signal turns OFF after the time that is set for the <b>STGOUT width</b> in the electronic flash settings has elapsed.
ACK	Command Completion Flag	This flag indicates when DI command execution is completed.	Turn ON when execu- tion of the DI command is completed	Turn OFF when the user (PLC) turns OFF the DI7 signal.

Cinnal	Cinnal name	Function	ON/OFF	F timing
Signal	Signal name	Function	OFF to ON	ON to OFF
ERR	Error Signal	This signal indicates when the Sensor Con- troller of the FH/FHV series detects errors. For details of the errors, refer to <i>Error Messages</i> <i>and Troubleshooting</i> in the <i>Vision System</i> <i>FH/FHV Series User's</i> <i>Manual (Cat. No.</i> <i>Z365).</i>	<ul> <li>It will turn ON in any of the following cases.</li> <li>Turn ON when the Sensor Cotnroller de- tects an error.</li> <li>Turns ON when a STEP signal is input while the READY sig- nal is OFF.</li> <li>Turns ON when a command which does not exist is is- sued.</li> </ul>	<ul> <li>Regardless of the OFF</li> <li>to ON condition set, it</li> <li>will turn OFF in any of</li> <li>the following cases.</li> <li>When the user (PLC)</li> <li>issues Error Clear</li> <li>(ERCLR signal: ON)</li> <li>command after the</li> <li>error is removed,</li> <li>When the STEP signal is input while the</li> <li>READY signal is ON</li> <li>When a valid command is issued</li> </ul>

# Multi-line Random-trigger Mode Signal Specifications

For parallel signals, the supported signal types and signal assignments depend on the number of lines used in *Multi-line Random-trigger Mode*.

The following tables show the differences in signal assignments and the signal types that can be used depending on the number of lines.

For details of terminal functions and assignments, refer to *Parallel interface*in the *Vision System FH* series Hardware Setup Manual (Cat. No. Z366).

## • FH-1000/2000/3000/5000 series Sensor Controller

### Signals and Assignments According to Number of Lines Used

1/0	Number of lines					
I/O	1 line	2 lines	3 or 4 lines	5 to 8 lines		
STEP	Assigned for each lin	e.				
DSA	Assigned for each lin	e.	Not supported.			
DI	The same signal is used for all lines.	The same signal is u The DILINE signal (w command) is added.	which specifies the line	number to send the		
ENC (Phase A, Phase B, or Phase Z)	Assigned for each lin	e.				
ACK	The same signal is u	sed for all lines.				
RUN	Assigned for each lin	e.		Not supported.		
GATE	Assigned for each lin	e.	Not supported.			
BUSY	Assigned for each lin	e.				
OR	Assigned for each lin	e.				
ERR	Assigned for each lin	e.		The same signal is used for all lines.		
READY	Assigned for each line.					
DO	DO0 to DO15	Line 0:DO0 to DO7 Line 1: DO8 to DO15	Not supported.			

### Signals According to Lines Used

### Two Lines

1/0	Line number			
I/O	Line 0	Line 1		
STEP	STEP0	STEP1		
DSA	DSA0	DSA1		
DLINE	DLINE0 (used for all lines)			
DI	DI0 to DI7 (used for all lines)			
ENC (Phase A, B, Z)	ENC0 Phase A, ENC0 Phase B, or ENC0 Phase Z *When an encoder is used, STEP0 is as- signed to ENC0 Phase Z.	ENC1 Phase A, ENC1 Phase B, or ENC1 Phase Z * When an encoder is used, STEP6 is as- signed to ENC1 Phase A, STEP7 is as- signed to ENC1 Phase B, and STEP1 is as- signed to ENC1 Phase Z.		
ACK	ACK (used for all lines)			
RUN	RUN0	RUN1		
GATE	GATE0	GATE1		
BUSY	BUSY0	BUSY1		
OR	OR0	OR1		
ERR	ERR0	ERR1		
READY	READY0	READY1		
DO	DO0 to DO7	DO8 to DO15		

### Three or Four Lines

1/0	Line number					
I/O	Line 0	Line 1	Line 2	Line 3		
STEP	STEP0	STEP1	STEP2	STEP3		
DSA	-					
DLINE		DILINE 0 to DILINE 1 (used for all lines) *DSA0 is assigned to DILINE1.				
DI	DI0 to DI7 (used for a	DI0 to DI7 (used for all lines)				
ENC (Phase A,						
Phase B, or Phase	-					
Z)						
ACK	ACK (used for all line	es)				
RUN	RUN0	RUN1	RUN2	RUN3		
GATE	-					
BUSY	BUSY0	BUSY1	BUSY2	BUSY3		
OR	OR0	OR1	OR2	OR3		
ERR	ERR0	ERR1	ERR2	ERR3		
READY	READY0	READY1	READY2	READY3		
DO	-					

### Five to Eight Lines

I/O	Line number							
1/0	Line 0	Line 1	Line 2	Line 3	Line 4	Line 4	Line 6	Line 7
STEP	STEP0	STEP1	STEP2	STEP3	STEP4	STEP5	STEP6	STEP7
DSA					-			

1/0				Line n	umber			
I/O	Line 0	Line 1	Line 2	Line 3	Line 4	Line 4	Line 6	Line 7
DLINE	DILINE 0 to DILINE 1 (used for all lines) *DSA0 is assigned to DILINE1 and DSA1 is assigned to DILINE2.							
DI	DI0 to DI7	(used for all	lines)					
ENC								
(Phase A,								
Phase B,					-			
or Phase								
Z)								
ACK	ACK (used	for all lines)						
RUN					-			
GATE					-			
BUSY	BUSY0	BUSY1	BUSY2	BUSY3	BUSY4	BUSY5	BUSY6	BUSY7
OR	OR0	OR1	OR2	OR3	OR4	OR5	OR6	OR7
ERR	ERRV (use	ERRV (used for all lines)						
READY	READY0	READY1	READY2	READY3	READY4	READY5	READY6	READY7
DO	-							

# **Input Timing of Input Signals**

## • STEP Signal Input Timing

The measurement trigger STEP signal is input with the following timing.

- (1) Turn ON the STEP signal when the BUSY signal is OFF. When multiple inputs are used, the STEP signal can be turned ON when the READY signal is ON. However, when the image mode is set to *Through Mode*, the READY signal will always be OFF, so check the status of the BUSY signal to determine when to input the STEP signal.
- (2) Check that the BUSY signal is ON, then turn OFF the STEP signal.

### **Additional Information**

If the STEP signal is turned ON when the READY signal is OFF, no measurements will be executed and the ERROR signal will turn ON.

## • DI0 to DI7 (Command Execution) Timing

۰FH

E

When executing continuous measurement commands, turn OFF DI7 when you want to stop continuous measurements, as shown below.

For continuous measurement commands, the ACK signal will remain OFF.

- (1) Set the DI0 to DI6 signals to ON or OFF based on the command to input.
- (2) After you have set the DI0 to DI6 signals, wait for at least 1 [ms] and then turn ON DI7.
- (3) The command will be executed, and the ACK signal will turn ON after execution of the command is completed.
- (4) Check that the ACK signal has turned ON, then turn OFF DI7. When the DI7 signal is turned OFF, the ACK signal will turn OFF.
- \* A timeout error will occur if the DI7 signal is not turned OFF within the set timeout interval from when the ACK signal is turned ON.

### Precautions for Correct Use

If the DI7 is still ON after execution of a command is completed, the same command will be executed again.

Confirm that the ACK signal is turned ON from OFF, and then create the program of the PLC side to turn the DI7 signal OFF from ON.

#### **Additional Information**

From the PLC, set signals DI0 to DI6 and turn ON the DI7 signal only when the BUSY, ACK, and DI7 signals are all OFF.

From the PLC, you can check if a command was acknowledged by confirming that the BUSY signal turned ON.

From the PLC, you can check if execution of a command was completed by confirming that the ACK signal turned ON.

After these conditions have all been met, turn OFF the DI7 signal.

### • FHV

Sensor control commands are input with the timing shown below using the DI0 to DI7 signals. In the FHV series, commands are executed with DI0, DI1, and DI7 signals.

- (1) Set the DI0 to DI6 signals to ON or OFF based on the command to input.
- (2) After you have set the DI0 to DI6 signals, wait for at least 1 ms and then turn ON DI7.
- (3) Then check that the BUSY signal has turned ON, then turn OFF DI7. The BUSY signal is turned OFF when execution of the command is completed. When executing continuous measurement commands, turn OFF DI7 when you want to stop continuous measurements.

#### Precautions for Correct Use

If the DI7 is still ON after execution of a command is completed, the same command will be executed again.

#### Additional Information

From the PLC, set signals DI0 to DI6 and turn ON the DI7 signal only when the BUSY and DI7 signals are OFF.

The PLC (user) turns OFF the DI7 signal after checking that the BUSY signal has turned ON.

# 2-6-9 Output Items

In the FHV series, this processing item is unavailable.

# Parallel Data Output

This processing item can not be used in the FHV series.

# Measurement Results for Which Output Is Possible (Parallel Data Output)

You can use the processing items that are related to outputting results to output the following data. You can also access measured values from processing units such as expressions.

Measured item Text string		Description		
Judgement	JG	Judgment result		
Data 0 to 7	D00 to D07	Results of expressions set for output data 0 to 7		

# • External Reference Tables (Parallel Data Output)

By specifying a number, the following data can be referenced from control commands or processing items that have a set/get processing unit data function.

Number	Data name	Get only	Data range
			0: No judgment (unmeasured)
0	Judgment	Get only	1: Judgment result OK
			-1: Judgment result NG
5 to 10	Data 0 to Data 7	Catarly	• BCD: -999 to 999
5 to 12	Data 0 to Data 7	Get only	• Binary: -2147483.648 to 2147483.647
400	Data tima	Set/Cet	0: Binary
128	Data type	Set/Get	1: BCD

# Parallel Judgment Output

This processing item can not be used in the FHV series.

## Measurement Results for Which Output Is Possible (Parallel Judgement Output)

You can use the processing items that are related to outputting results to output the following data. You can also access measured values from the processing units such as expressions.

Measured item	Text string	Description
Judgment	JG	Judgment result
Data 0 to 15	D00 to D15	Results of expressions set for output judgment data 0 to 15
Judge 0 to 15	J00 to J15	Results of judgment on expressions set for output judgment da-
		ta 0 to 15

# • External Reference Tables (Parallel Judgment Output)

By specifying a number, the following data can be referenced from control commands or processing items that have a set/get processing unit data function.

Number	Data name	Set/Get	Data range
			0: No judgment (unmeasured)
0	Judgment	Get only	1: Judgment result OK
5 to 20	Data0 to Data 15	Get only	-1: Judgment result NG -999999999999999 to 99999999999999
5 10 20		Get only	0: No judgment (unmeasured)
21 to 36	Judge 0 to Judge 15	Get only	1: Judgment result OK
211000			-1: Judgment result NG
103	Reflect to the overall judg- ment	Set/Get	0: ON, 1: OFF
136	Upper limit 0 for judgment	Set/Get	-9999999999999999999999999999999999999
137	Lower limit 0 for judgment	Set/Get	-9999999999999999999999999999999999999
138	Upper limit 1 for judgment	Set/Get	-9999999999.9999 to 999999999.9999
139	Lower limit 1 for judgment	Set/Get	-9999999999999999999999999999999999999
140	Upper limit 2 for judgment	Set/Get	-9999999999999999999999999999999999999
141	Lower limit 2 for judgment	Set/Get	-9999999999999999999999999999999999999
142	Upper limit 3 for judgment	Set/Get	-9999999999999999999999999999999999999
143	Lower limit 3 for judgment	Set/Get	-9999999999999999999999999999999999999

## 2-6-10 Command Formats

You can input commands to control the Sensor from an external device using the DI0 to DI7 signals.

# Input Format

Commands are input in the following formats.

### ●FH

One Line

Input format (DI7 to DI0)

Set 0 (OFF) or 1 (ON) for each DI signal.

Confirm commands and information, and turn DI7 (execution) ON with an interval of at least 1 [ms]. • Multi-line Random-trigger Mode

Two Lines

Input format (DI7 to DI0 and DILINE0)

### •FHV

Input format (DI7 to DI0)

Set 0 (OFF) or 1 (ON) for each DI signal. Confirm commands and information, and turn DI7 (execution) ON with an interval of at least 1 [ms].

### **Precautions for Correct Use**

In FHV series, commands equivalent to those of the FH series is available when the Smart Camera data unit interface is connected.

# **Command Lists**

The commands and command formats are described in the following tables.

## • One Line

• FH

			Input format (DI7 to DI0)				
Data	Description	Execute (DI7)	Command (DI6, DI5)	Command information (DI4 to DI0)	Input ex- ample		
Continu- ous Meas- urement	Performs measurement continuously while com- mand is being input.	1	00	***** The Sensor Controller does not check this sig- nal, so a setting of either 0 or 1 makes no differ- ence.	10000000		
Switch Scene	Switches the measure- ment scene.	1	01	Input [Scene No.] in bi- nary format (0 to 31).	Switching to Scene 2: 10100010		
Switch Scene Group	Switches the measure- ment scene groups.	1	11	Input [Scene Group No.] in binary format (0 to 31).	Switching to Scene Group 2: 11100010		
Clear Measure- ment Val- ues	Clears measurement values. The OR signal and DO signal are not cleared.	1	10	00000	11000000		
Clear Error	Clears the error output. The ERROR indicator is also cleared.	1	10	00001	11000001		
Clear Par- allel OR +DO	Clears the OR signal and DO signal.	1	10	00010	11000010		
Clear Wait State	Clears the wait state of the parallel flow control processing item.	1	10	01111	11001111		

0: OFF 1: ON

<sup>•</sup> FHV

		Input form	Input exam-	
Data	Description	Execute (DI7)	Command (DI1, DI0)	ple
Clear Measure- ment Values, Er- ror, OR	Clears the measurement values, OR signal, and Error signal. The ERROR indicator is also cleared.	1	10	110

0: OFF 1: ON

# • Multi-line Random-trigger Mode

### • FH

		(Г		Input format DILINE0, DILINE1, a	and DILINE2)	Input ex- ample (DI-
Data	Description	Exe- cute (DI7)	Com- mand (DI6, DI5)	Command information (DI4 to DI0)	Line number	LINE2 to DILINE0, DI7 to DI5, and DI4 to DI0)
Continuous Measure- ment	Performs meas- urement continu- ously while com- mand is being in- put.	1	00	***** The Sensor Con- troller does not check this signal, so a setting of ei- ther 0 or 1 makes no difference.		Continuous measure- ment on line 1 when 2 lines are used: 0 100 00000
Switch Scene	Switches the measurement scene.	1	01	Input [Scene No.] in binary format (0 to 31).	Specify the line number to send a command to.	Switching to scene 2 on line 2 when 4 lines are used: 10 101 00010
Switch Scene Group	Switches the measurement scene groups.	1	11	Input [Scene Group No.] in bi- nary format (0 to 31).	<ul> <li>Two lines: 0 or 1</li> <li>Three or four lines: 00 (line 0) 01 (line 1)</li> </ul>	Switching to scene group 3 on line 6 when 8 lines are used: 110 111 00011
Clear Measure- ment Val- ues	Clears measure- ment values. The OR signal and DO signal are not cleared.	1	10	00000	10 (line 2) 11 (line 3) Five to eight lines: 000 (line 0) 001 (line 1) 010 (line 2) 011 (line 3) 100 (line 4)	Clearing the meas- urement re- sults for line 1 when 2 lines are used: 1 110 00000
Clear Error	Clears the error output. The ERROR indi- cator is also cleared.	1	10	00001	100 (line 4) 101 (line 5) 110 (line 6) 111 (line 7)	Clearing the error status for line 1 when 4 lines are used: 01 110 00001
Clear Par- allel OR +DO	Clears the OR sig- nal and DO signal. *2	1	10	00010		Clearing the OR and Do signals for line 2 when 8 lines are used: 010 110 00010

		(D	Input ex- ample (DI-			
Data	Description	Exe- cute (DI7)	Com- mand (DI6, DI5)	Command information (DI4 to DI0)	Line number *1	LINE2 to DILINE0, DI7 to DI5, and DI4 to DI0)
Clear Wait State	Clears the wait state of the paral- lel flow control processing item.	1	10	01111		11001111

\*1. Two lines: DILINE0 Three or four lines: DILINE0 and DILINE1 Five to eight lines: DILINE0 to DILINE2

\*2. Only the signals assigned to the line to which a command was sent can be cleared. The OR and DO signals are not cleared for other lines. If the command is sent to a line that cannot use the DO signals, only the OR signal will be cleared.

## 2-6-11 Time Charts

The ON/OFF timing of related signals during data output after the completion of measurement and during the sequence of operation from input of the control command until data output after the completion of measurement is indicated below in a timing chart.

# Timing chart at startup

This section describes the timing chart at startup.

# h

## Precautions for Correct Use

- For details of functions and operation of each signal, refer to 2-6-8 I/O Signals on page 2-378.
- Input the STEP signals and DI0 to DI7 signals after the RUN signal turns ON.

READY signal	ON OFF	Power ON		
RUN signal	ON OFF			
STEP signal	ON OFF			

- (1) Turn ON power.
- (2) The READY signal turns ON when the trigger signal becomes acceptable.
- (3) The STEP signal is input after checking the RUN signal is ON.

# **Output Control Timing Charts**

This section provides timing charts for each output control type (none, handshaking, and synchronization output).

In the FHV series, there is no DO 0 to DO 15, GATE signal.

### **Precautions for Correct Use**

• For details of functions and operation of each signal, refer to 2-6-8 I/O Signals on page 2-378.

## • Output Control: None

Example: Three Data Items Set for Parallel Data Output Time Chart

- (1) Turn ON the STEP signal while the BUSY signal is OFF.
- (2) Measurement begins and the BUSY signal is turned ON during the measurement process.
- (3) Measurement data is output when a Parallel Data Output Unit in the measurement flow is executed.
- (4) After the data output processing, the GATE signal is turned ON after the time set for the Gate ON delay in the parallel communications settings has elapsed.
   A delay of up to 1 [ms] will occur when the GATE signal is turned ON. (This applied only to the FH.) Set the GATE ON delay and output time for the GATE signal so that the total time does not exceed the output period.
- (5) After the GATE signal is turned ON, the GATE signal is turned OFF after the time set for the **Output time** in the parallel communications settings has elapsed. Set the GATE ON delay and output time for the GATE signal so that the total time does not exceed the output period.
- (6) If the output processing for the next data item is completed, the next GATE signal will be turned ON after the time set for the **Output period** has elapsed from the end of processing in step 5 above.
- (7) After measurement is completed, the OR signal is output based on the measurement results and the BUSY signal is turned OFF.

## **Precautions for Correct Use**

## Data Output Time and STEP Signal Input Interval

Set the input interval for the STEP signal so that it is longer than the total output time. If the STEP signal input interval were shorter than the total output time, the data output buffer will eventually overflow and data will be lost.

## **Additional Information**

When the parallel judgment output unit is performed, the GATE signal turns ON once.

# Output Control: Handshaking

- (1) Turn ON the STEP signal while the BUSY signal is OFF.
- (2) Measurement begins and the BUSY signal is turned ON during the measurement process.
- Turn ON the DSA signal from the external device to request data transmission after the STEP signal (3)turns ON.

A timeout error will occur if the DSA signal were not turned ON within the set timeout interval from when the output data was output by the Output Unit in the measurement flow. (1)

- After measurement is completed, the OR signal is output based on the measurement results and the (4) BUSY signal is turned OFF.
- Measurement data is output when a Parallel Data Output Unit in the measurement flow is executed. (5)
- (6) The GATE signal is turned ON if the DSA signal is ON after data output processing. A delay of up to 1 [ms] will occur when the GATE signal is turned ON. (This applied only to the FH.)

- (7) The user (PLC) reads the data and turns OFF the DSA signal when the GATE signal turns ON. A timeout error will occur, if the DSA signal were not turned OFF within the specified time after the GATE signal turned ON. (2)
- (8) The GATE signal turns OFF if the DSA signal is turned OFF.
   A timeout error will occur, if the DSA signal were not turned OFF within the specified time after the GATE signal turned ON. (2)
- (9) A timeout error will occur, if more than one data item is being output for one measurement and you do not turn ON the DSA signal within the specified timeout time after the GATE signal turns OFF. (3)

### **Additional Information**

When the parallel judgment output unit is performed, the GATE signal turns ON once if the DSA signal is ON.

## • Output Control: Synchronization Control

Operation When Number of Delays Is Set to 2:

- (1) Turn ON the STEP signal while the BUSY signal is OFF.
- (2) The Overall Judgment (OR) signal is output when BUSY signal switched from ON to OFF.
- (3) When the STEP signal turns ON for the third time, the measurement results (DO) for the first time that the STEP signal turned ON are output and the GATE signal is turned ON after the time set for the GATE ON delay has elapsed.
- (4) When the STEP signal turns ON for the fourth time, the measurement results (DO) for the second time that the STEP signal turned ON are output and the GATE signal is turned ON after the time set for the GATE ON delay has elapsed.

A delay of up to 1 [ms] will occur when the GATE signal is turned ON. (This applied only to the FH.)

(5) Each time the STEP signal turns ON after that, the measurement result (DO) from when the STEP signal turned ON two times previously is output.

# **Command Timing Charts**

### Precautions for Correct Use

• For details of functions and operation of each signal, refer to 2-6-8 I/O Signals on page 2-378.

### • Continuous Measurement

Measurement is performed continuously while the DI7 signal is ON. Continuous measurement is stopped when the DI7 signal is turned OFF.

When an Expression Is Set in Parallel Data Output with No Output Control:

Time Chart	
DI5 to DI6 are turned OFF.	ON OFF
DI7 signal	ON OFF Continuous Heasurement /Measurement End of continuous
BUSY signal	ON OFF
OR signal	ON while the measurement process is being executed. OR signal is not applied to load while measurement is running.
DO signal	Data 0 Data 0 Data 0 turned OFF.
GATE signal	OR Delay time <sup>11</sup> Gate ON delay [ms] OFF Output period
ACK signal	ON OFF
	*1 A delay of up to 1 ms will occur when the GATE signal is turned ON. (This applied only to the FH.)

Signal	Description
DI5 to DI6	These signals are turned OFF during continuous measurement. (i.e., while DI7 is ON.)
DI7	This is the execution trigger. After DI0 to DI6 are set, turn ON DI7 after an interval over 1 [ms]. Always keep this signal turned ON during continuous measurement. Continuous measure- ment is stopped when this signal is turned OFF.

### **Precautions for Correct Use**

- The measurement during continuous measurement is given priority. Therefore, display of the measurement results (overall judgment, images, judgment for each processing unit in the flow display, and detailed results) may sometimes not be updated.
- Load the OR signal of the last continuously measurement result when BUSY signal is turned OFF.
- When continuous measurement are ended, the measurement results from the last measurement will be displayed.
- OR signal is not applied to load while measurement is running. When you want to get the Overall judgment result during measurement, assign *TJG* to the *Parallel Data Output* or *Parallel Judgment Output*. For details, refer to *1-3-1 Basic Control Operations of the Sensor Controller* on page 1-4.
- After the continuous measurement was completed, read the OR signal for the last measurement results at the time when the BUSY signal switched from ON to OFF.

#### **Additional Information**

- When the input command is not received correctly, the ERROR signal turns ON.
- Acquisition is difficult because the amount of time during which the BUSY signal is OFF during continuous measurement for a parallel command is extremely short (1 [ms] or less). Get the OR signal when the GATE signal turns ON after adding the parallel judgment output at the end of the flow.

2-6-11 Time Charts

## • Scene/Scene Group Switch

Scenes and scene groups are switched as follows.

After the number of the desired scene or scene group is set in DI0 to DI6, turning ON DI7 switches the scene or scene group to the number set.

#### Time Charts

#### Output Signals

Signal	Description
BUSY	Indicates that the Sensor Controller is currently switching the scene or scene group.
	Do not input next command while the BUSY signal is ON. Otherwise, on-going process-
	ing or commands that are input will not be performed correctly.
READY	Turns OFF while a scene or a scene group is being switched.
	Turns OFF as long as the BUSY signal is ON.
ACK	Turns ON when execution of the DI command is completed.

### Additional Information

When the input command is not received correctly, the ERROR signal turns ON.

### Precautions for Correct Use

Do not switch the scene group during parallel continuous measurement or when the STEP signal is being input continuously. If you must switch the scene group at one of these times, set *Unchecked* in *Save scene group on scene switch* in either of the settings items below.

- Refer to Changing the Scene or Scene Group in the Vision System FH/FHV Series User's Manual (Cat. No.Z365).
- Refer to Setting the Conditions That Are Related to Operation during Measurement in the Vision System FH/FHV Series User's Manual (Cat. No.Z365).
- Input Signals (Scene/Scene Group Switching)

Signal	Description
DI0 to DI4	Sets the scene number (0 to 31).
	When a DI terminal offset is set, the set offset is added.
DI5	ON
DI6	Scene switching: OFF
	Scene Group switching: ON
DI7	This is the execution trigger.
	After DI0 to DI6 are set, turn ON DI7 after an interval over 1 [ms].
	After checking that the ACK signal has turned ON, turn DI7 OFF and then turn DI0 to DI6
	OFF.
	Refer to Setting the Conditions That Are Related to Operation during Measurement in the
	Vision System FH/FHV Series User's Manual (Cat. No. Z365).

### **Additional Information**

The amount of time during which the BUSY signal is turned ON when a scene is switched can be changed.

Select **Measurement setting]** from the **Measure** menu and make the setting in the conditions related to operation during measurement.

Refer to Setting the Conditions That Are Related to Operation during Measurement in the Vision System FH/FHV Series User's Manual (Cat. No.Z365).

## • Clear Measurement Values

The measurement result is cleared as follows.

#### Time Charts

#### Output Signals

Signal	Description
BUSY	Turns ON when the measurement value is being cleared.
	The amount of time during which the BUSY signal is turned ON is approximately 1 [ms].
READY	Turns OFF when the command to clear the measurement value is being executed.
ACK	Turns ON when execution of the DI command is completed.

Signal	Description
DI0 to DI4	Turns OFF.
DI5	Turns OFF.
DI6	Turns ON.
DI7	This is the trigger signal to clear a measurement value. After DI0 to DI6 are set, turn ON DI7 after an interval over 1 [ms]. After checking that the ACK signal has turned ON, turn DI7 OFF and then turn DI0 to DI6 OFF. Note, however, that the amount of time during which the BUSY signal is turned ON is ap- proximately 1 [ms]. If it cannot be recognized whether the BUSY signal is turned ON or not by an external device, control the timing so that the DI7 signal is turned ON for ap- proximately 5 [ms].

## Clear Parallel OR+DO

The OR signal and DO signals are cleared as follows.

### • Time Chart

### FH:

### Output Signals

Signal	Description
BUSY	Turns ON while the OR and DO signals are cleared. The amount of time during which the BUSY signal is turned ON is approximately 1 [ms].
	BOST signal is turned ON is approximately 1 [ms].
READY	Turns OFF while the command to clear the OR and DO signals is executed.
ACK	Turns ON when execution of the DI command was completed.
OR	It will turn OFF if it was turned ON.
DO0 to DO15	It will turn OFF if it was turned ON.

Signal	Description
DIO	Turns OFF.
DI1	Turns ON.
DI2 to DI4	Turns OFF.
DI5	Turns OFF.
DI6	Turns ON.
DI7	This is the trigger signal to clear the OR and DO signal. After DI0 to DI6 are set, turn ON DI7 after an interval over 1 [ms]. After checking that the ACK signal has turned ON, turns DI7 OFF and then turn DI0 to DI6 OFF.
	Note, however, that the amount of time during which the BUSY signal is turned ON is approximately 1 [ms]. If an external device could not recognized the BUSY signal state, control the timing so that the DI7 signal is turned ON for approximately 5 [ms].

## • Clear Error

The error signal is cleared as follows.

#### • Time Chart

### FH:

### Output Signals

Signal	Description
BUSY	Turns ON while the ERROR signal is cleared. The amount of time during which the
	BUSY signal is turned ON is approximately 1 [ms].
READY	Turns OFF while the command to clear the ERROR signal is executed.
ACK	Turns ON when execution of the DI command was completed.
ERROR	After the error is removed, the signal turns OFF when the FH executes the error clear
	processing.

Signal	Description
DI0	Turns ON.
DI1 to DI4	Turns OFF.
DI5	Turns OFF.
DI6	Turns ON.
DI7	This is the trigger signal to clear an error. After DI0 to DI6 are set, turn ON DI7 after an interval over 1 [ms]. After checking that the ACK signal has turned ON, turns DI7 OFF and then turn DI0 to DI6 OFF. Note, however, that the amount of time during which the BUSY signal is turned ON is ap- proximately 1 [ms]. If an external device could not recognized the BUSY signal state, control the timing so that the DI7 signal is turned ON for approximately 5 [ms].

## • Clear Measurement Values, Error, OR

Clears the Measurement Values, OR signal and Error signal. The ERROR indicator is also cleared.

### • Time Chart

FHV:	
DI1, DI0 signal	10 The signal is turned OFF when the DI7 signal turns OFF.
DI7 signal	Allow at least 1 ms ON and then turn ON D17. The signal is turned OFF when the BUSY OFF OFF
STEP signal	ON signal turns ON.
BUSY signal	ON Input Clear OFF Measurement
READY signal	ON OFF
OR signal	ON OFF
ERROR signal	ON

Refe to *Clear Measurement Values* on page 2-404, *Clear Parallel OR+DO* on page 2-405, *Clear Error* on page 2-406 when using the Data Unit for the Smart Camera (Parallel Interface) FHV-SDU10.

### Output Signals

Signal	Description
BUSY	The BUSY signal is ON during the command execution. The amount of time during which the BUSY signal is turned ON is approximately 1 [ms].
READY	The READY signal is OFF during the command execution.
OR	It will turn OFF if it was turned ON.
ERROR	After the error is removed, the signal turns OFF when the FHV executes the error clear processing.

Signal	Description
D10	Turns OFF.
DI1	Turns ON.

Signal	Description
DI7	This is the trigger signal to clear Measurement Values, Error, OR signals.
	After DI0 and DI1 are set, turn ON DI7 after an interval over 1 [ms].
	The BUSY signal is ON during command execution. After checking that the BUSY signal
	has turned ON, turn DI7 OFF, and then turn DI0, DI1 OFF.
	Note, however, that the amount of time during which the BUSY signal is turned ON is ap-
	proximately 1 [ms]. If it cannot be recognized whether the BUSY signal is turned ON or
	not by an external device, control the timing so that the DI7 signal is turned ON for ap-
	proximately 5 [ms].

# 2-6-12 Parallel Troubleshooting

Problem	Cause	Action
Data is not output at all.	You have selected more than three lines in Multi-line Random-trigger Mode.	Decrease the number of lines or use a communications method oth- er than parallel communications.
	The Output setting is turned OFF.	Select <b>Layout setup</b> in the Window menu on the Main Window, and then turn ON the <i>Output</i> setting.
Even though there is more than one data output item, only the last data item is output.	The data is being overwritten be- cause the ON status of the GATE signal is not being checked.	Read data only when the GATE sig- nal is ON. Use handshaking for the output control to control the output timing.
STGOUT and SHTOUT are not be- ing output.	You have selected a different signal in the system settings.	Select the correct signal for the ap- plication in the <i>Output signal</i> <i>selection</i> of the output signal set- tings in the system settings.
Measurement is not executed even when a STEP signal is input.	The STEP signal is chattering.	Check the contacts and input meth- od used to prevent chattering. Set the STEP signal filter to a peri- od longer than the input period that results in chattering.
The STEP signal is input at ran- dom.	Unintended STEP signals are being input due to noise.	Perform noise prevention meas- ures. Set the STEP signal filter to a period longer than the input period that results in chattering.
The READY signal remains OFF.	The image mode is set to <i>Through Mode</i> on the Main Window.	Change the image mode to <i>Freeze</i> or <i>Last NG</i> .
	Camera Image Input HDR or Camera Image Input HDR Lite is being used in the current measure- ment flow.	When using <b>Camera Image Input</b> <b>HDR</b> or <b>Camera Image Input HDR</b> <b>Lite</b> , the READY signal will turn OFF for the number of Camera im- ages taken.
	More than one Camera Image Input is being used in the current meas- urement flow.	If you execute more than one <b>Camera Image Input</b> in a single measurement flow, the Ready sig- nal will turn OFF for the number of Camera images taken.
There is a delay in the SHTOUT ON timing.	You are using more than one Camera in the current measurement flow.	When you use more than one Cam- era, the SHTOUT signal turns ON only after the slowest Camera ex- posure is completed.

Α

# A-1 Command Control

This section describes the commands that are used to control the Sensor Controller from an external device.

A-1-1

#### Parameter Notation Examples for Command Control

This section provides examples of binary inputs of parameters such as arguments for command control.

#### Additional Information

The storage order depends on the manufacturer of the connected PLC as follows:

- OMRON and Yaskawa Electric PLCs: Upper byte followed by lower byte
- Mitsubishi Electric PLCs: Lower byte followed by upper byte<sup>\*1</sup>
- \*1: The order of displayed sequence program may be from upper byte to low byte. If it does not perform correctly, confirm the order of upper and low byte.

#### Four-byte Data

The following example shows the input to switch the scene to scene number 5 with the Switch Scene command.

First word in Command Area	Description
+2 and +3 words	Command code: (1000 0030 hex)
+4 and +5 words	Scene number: (0000 0005 hex)

#### OMRON or Yaskawa Electric PLCs

Command (PLC to Sensor Controller)

First word in	Hexadecimal		В			
Command Area	notation	15 - 12	11 - 8	7 - 4	3 - 0	Description
+2	1000	0001	0000	0000	0000	Command code
+3	0030	0000	0000	0011	0000	
+4	0005	0000	0000	0000	0101	Scene number
+5	0000	0000	0000	0000	0000	

#### Mitsubishi Electric PLCs

Command (PLC to Sensor Controller)

First word in	Hexadecimal		В			
Command Area	notation	15 - 12	11 - 8	7 - 4	3 - 0	Description
+2	1000	0001	0000	0000	0000	Command code
+3	0030	0000	0000	0011	0000	
+4	0500	0000	0101	0000	0000	Scene number
+5	0000	0000	0000	0000	0000	

#### • Specifying Character Strings

Specify the ASCII character code for every two bytes.

In this example, the inputs are given to save the image data for image data 1 to a destination specified by the absolute path (USBDisk\IMG01\LABEL.IFZ) with the Save Image command.

First word in Command Area	Description
+2 and +3 words	Command code: (4000 0070 hex)
+4 and +5 words	Image data number: 1 (0000 0001 hex)
+6 and +7 words	Save destination: (USBDisk\IMG01\LABEL.IFZ)

#### OMRON or Yaskawa Electric PLCs

+16	492e	0100	1001	0010	1110	
+17	5a46	0101	1010	0100	0110	

#### • Specifying Real Numbers

Specify the actual value multiplied by 1,000 to specify a real number.

In this example, the inputs are given to set the lower limit value (external reference number 137) of measurement coordinate X to 123.4 for the *Search* processing item that is registered to processing unit 1 by the Set Unit Data command.

First word in Command Area	Description
+2 and +3 words	Command code: (1000 0050 hex)
+4 and +5 words	Unit number: 1 (0000 0001 hex)
+6 and +7 words	External reference number: 137 (0000 0089 hex)
+8 and +9 words	Lower limit of measurement coordinate X: 123.4 (x 1,000: 123,400 = 0001 E208 hex)

#### OMRON or Yaskawa Electric PLCs

+9	0100	0000	0001	0000	0000	nate X

### A-1-2 Details of Commands Used in EtherCAT Communications

Command codes and command parameters used in EtherCAT communications are specified as described below via the I/O port.

Command Code	:Holds the command code to execute.
Command Parameter 0 to 3	:Holds the parameter for the command to execute.

# 也

#### Precautions for Correct Use

Since Command Parameter 3 is the reserved area, it is unavailable. Use Command Parameter 0 to 2.

Command details written in the Appendix are described based on PLC memory addresses. When specifying command codes and command parameters in EtherCAT communications, replace the command details with the description in the table below.

First word in	Command		E	Bit	
Command Area	Code	15-12	11-8	7-4	3-0
+2	0000	0000	0000	0000	0000
+3	0000	0000	0000	0000	0000
+4	0000	0000	0000	0000	0000
+5	0000	0000	0000	0000	0000
+6	0000	0000	0000	0000	0000
+7	0000	0000	0000	0000	0000
+8	0000	0000	0000	0000	0000
+9	0000	0000	0000	0000	0000
+10	0000	0000	0000	0000	0000
+11	0000	0000	0000	0000	0000

#### A-1-3 Command List

This section lists the commands that you can use with the FH or FHV series and the communications protocols for which each command is supported.

#### Additional Information

In addition to the standard communication commands that are given here, you can also create custom commands and define the processing for them.

Creating custom commands is useful to expand the function of a standard command to create more advanced commands, and to otherwise combine multiple commands into one command to simplify controlling operation from a PLC or other external device.

Refer to *Custom Communications Commands* in the *Vision System FH/FHV Series User's Manual (Cat. No. Z365).* 

#### Precautions for Correct Use

- In the FHV, parallel commands other than measurements, errors, and OR signal clear are available when the parallel I/O signal extension unit (FHV-SDU10) for the Smart Camera data unit is connected. If not connected, only measurements, errors, and OR signal clear can be used.
- In the FHV, EtherCAT communication commands are available only when the EtherCAT interface communication unit (FHV-SDU30) for the Smart Camera data unit is connected.

#### • Execution Commands

OK: Applicable command, RST: Command with restricted execution, NA: Non-applicable command

Function	Parallel Ref.: page 2-392	PLC link Ref.: page 2-175	EtherNet/IP Ref.: page 2-239	EtherCAT Ref.: page 2-51	PROFINET Ref.: page 2-299	Non-pro- cedure Ref.: page 2-342

\*1. You can execute the same operation with the Measurement Execution Bit (STEP signal is allocated for the parallel communications, EtherNet/IP, and PROFINET) in the control signals.

\*2. You cannot execute tag data link commands. Execute the command with message communications.

\*3. You can execute the same operation with the Error Clear Bit (EtherNet/IP and PROFINET: ERCLR, EtherCAT: Error Clear) in the control signals.

\*4. Clear Measurement Values, Error, OR is only possible in the FHV series.

#### Commands to Get Status

Function	Parallel	PLC Link Ref.: page 2-176	EtherNet/IP Ref.: page 2-240	EtherCAT Ref.: page 2-52	PROFINET Ref.: page 2-299	Non-pro- cedure Ref.: page 2-342
Gets the current scene number.	NA	ОК	ОК	ОК	ОК	ОК
Gets the current scene group number.	NA	ОК	ОК	ОК	ОК	OK
Gets the number of the layout that is currently displayed.	NA	ОК	ОК	ОК	ОК	OK
Gets the number of the Unit that is currently dis- played in the specified image display window.	NA	ОК	ОК	ОК	ОК	ОК
Gets the sub-image num- ber that is currently dis- played in the specified image display window.	NA	ОК	ОК	ОК	ОК	ОК
Gets the image mode for the specified image dis- play window.	NA	ОК	ОК	ОК	ОК	OK
Gets the input status (prohibited/permitted) for the Communications Modules.	NA	ОК	ОК	ОК	ОК	ОК
Gets the output status (prohibited/permitted) to an external device.	NA	ОК	ОК	ОК	ОК	OK
Gets the ON/OFF status for the specified parallel I/O terminal.	NA	ОК	ОК	ОК	ОК	OK
Gets the ON/OFF status of all parallel terminals except for DI terminals.	NA	ОК	ОК	ОК	ОК	OK
Gets the ON/OFF status of all parallel DI termi- nals.	NA	ОК	ОК	ОК	ОК	OK
Gets the user name for the user account current- ly logged in.	NA	ОК	RST <sup>*1</sup>	NA	NA	OK
Gets the group ID for the account currently logged in.	NA	ОК	RST <sup>*1</sup>	NA	NA	OK
Gets the current state of the operation log.	NA	ОК	ОК	ОК	ОК	ОК

OK: Applicable command, RST: Command with restricted execution, NA: Non-applicable command

#### • Commands to Set Status

Function	Parallel Ref.: page 2-392	PLC link Ref.: page 2-176	EtherNet/IP Ref.: page 2-240	EtherCAT Ref.: page 2-52	PROFINET Ref.: page 2-300	Non-pro- cedure Ref.: page 2-343
Switches to the specified scene number.	ОК	ОК	ОК	ОК	ОК	ОК
Switches to the scene group with the specified number.	ОК	ОК	ОК	ОК	ОК	ОК
Sets the layout number and switches the image.	NA	ОК	ОК	ОК	ОК	ОК
Sets the number of the Unit to display in the specified image display window.	NA	ОК	ОК	ОК	ОК	ОК
Sets the number of the sub-image to display in the specified image dis- play window.	NA	ОК	ОК	ОК	ОК	ОК
Sets the image mode for the specified image dis- play window.	NA	ОК	ОК	ОК	ОК	ОК

Sets the prefix for the file name in which logged images are saved.	NA	ОК	RST <sup>*1</sup>	NA	NA	ОК
Sets the data logging conditions.	NA	ОК	ОК	ОК	ОК	OK
Sets the parallel DI termi- nal offset data.	NA	ОК	ОК	ОК	ОК	ОК

OK: Applicable command, RST: Command with restricted execution, NA: Non-applicable command

\*1. You cannot execute tag data link commands. Execute the command with message communications.

\*2. When you save data, the save destination differs depending on Sensor Controller model. The save destination differ depending on the Sensor Controller type.

When you use FH series/FHV, do not save to the any folder except RAMDisk and external storage device (such as C:\ProgramFiles\FZ). It is possible not to perform correctly due to the decrease of Scene data storage region.

Save destination	FH/FHV series
RAMDisk	C:\Data\RAMDisk
External storage	E: F: G: H: M:\

#### • File Load Commands

The load destination differs depending on the Sensor Controller model.

Load destination	FH/FHV series
RAMDisk	C:\Data\RAMDisk
External storage	E: F: G: H: M:\

OK: Applicable command, RST: Command with restricted execution, NA: Non-applicable command

Function	Parallel	PLC link Ref.: page 2-177	EtherNet/IP Ref.: page 2-242	EtherCAT	PROFINET	Nonproce- dure Ref.: page 2-345
Loads the scene data.	NA	ОК	RST <sup>*1</sup>	NA	NA	OK
Loads the scene group data.	NA	ОК	RST <sup>*1</sup>	NA	NA	ОК
Loads the system data.	NA	ОК	RST <sup>*1</sup>	NA	NA	OK
Loads the system + scene group 0 data.	NA	ОК	RST <sup>*1</sup>	NA	NA	ОК

\*1. You cannot execute tag data link commands. Execute the command with message communications.

#### • File Save Commands

The save destination to use differs by Sensor Controller model.

When you use FH series/FHV series, do not save to the any folder except RAMDisk and storage device (such as C:\Program Files\FZ). It is possible not to perform correctly due to the decrease of Scene data storage region.

Save destination	FH/FHV series
RAMDisk	C:\Data\RAMDisk
External storage	E: F: G: H: M:\

OK: Applicable command, RST: Command with restricted execution, NA: Non-applicable command

Function	Parallel	PLC link Ref.: page 2-178	EtherNet/IP Ref.: page 2-242	EtherCAT	PROFINET	Non-pro- cedure Ref.: page 2-345
Saves the scene data.	NA	ОК	RST <sup>*1</sup>	NA	NA	OK
Saves the scene group data.	NA	ОК	RST <sup>*1</sup>	NA	NA	ОК
Saves the system data.	NA	ОК	RST <sup>*1</sup>	NA	NA	ОК
Saves the image data stored in the the Sensor Controller's memory.	NA	ОК	RST*1	NA	NA	OK
Saves all image data in the Sensor Controller's memory with ifz format in external storage.	NA	ОК	RST <sup>*1</sup>	NA	NA	ОК
Saves the last logging image.	NA	ОК	RST <sup>*1</sup>	NA	NA	ОК

Function	Parallel	PLC link Ref.: page 2-178	EtherNet/IP Ref.: page 2-242	EtherCAT	PROFINET	Non-pro- cedure Ref.: page 2-345
Saves the system + scene group 0 data that is currently used by the Sensor Controller in a file.	NA	ОК	RST <sup>*1</sup>	NA	NA	ОК
Captures the screen.	NA	ОК	RST <sup>*1</sup>	NA	NA	OK

#### A-1-4 Command Details for PLC Link, EtherNet/IP, EtherCAT, and PRO-FINET

This section provides details on the communications commands.

# Single Measurement

Performs measurement one time.

#### Command (PLC to Sensor Controller)

First word in	Command		В			
Command Area	code	15 - 12	11 - 8	7 - 4	3 - 0	Description

# Scroll

The image display window whose number is specified is moved to the specified distance in parallel. The setting range for the movement distance is not restricted. Also, because the scale for movement is independent of the display zoom ratio, the movement is not affected by change in the zoom ratio.

First word in	First word in Command		B	Bit

# Move Scene Data

Copies the data for the scene with the number specified with command argument 1 to the scene with the number specified with command argument 2.

Deletes scene data with a number specified by command argument 1 after completing copying. If there is already data at the copy destination, the copied data is written over that data.

#### Response (Sensor Controller to PLC)

# Register Image Data

Registers the specified image data as a registered image.

After the command is executed, the status will be the same as when the image was registered with the Registered Image Manager. If the source is the last measured image (0), command argument 3 (log-ged image number of file name) can be omitted.

# Restart

Restarts the Sensor Controller.

#### rh

#### Precautions for Correct Use

When the Restart command is executed, BUSY does not turn off even after the command execution bit turns off.

After the Restart command is executed, perform a memory clear of BUSY on the PLC side.

# **Get Parallel Terminal Status**

Gets the ON/OFF status for the specified parallel I/O terminal.

Set the parallel I/O terminals with the terminal type and number.

For how to set, refer to the following example and the description in the table. Example:

When you want to get the terminal status of STEP0 in Line 0.

- 1. Select 0 in the terminal type. STEP is set.
- 2. Select 0 in the terminal number, STEP0 of Line0 is set.
- 3. Send the settings specified in the above step 1 and 2 to the specified port number of Line0.
- 4. The specified terminal status will be responded.

### Command (PLC to Sensor Controller)

First word in	Command		E	Bit		
Command Area	code	15 - 12	11 - 8	7 - 4	3 - 0	Description

### **Precautions for Correct Use**

- When the Multi-line Random-trigger mode is selected in the following series, usable signal type or assignment are differ depending on the used number of Lines.
  - FH-1000 series
  - FH-2000 series
  - FH-3000 series
  - FH-5000 series

For more details of Operation mode, refer to *Multi-line Random-trigger Mode Signal Specifications* on page 2-384.

• The terminal status of each line can be got by sending this command to the port number allocated to them. For signals that are common in all lines, the terminal status can be got from any line used.

When the terminal status for an unusable line or a different line was got, the response code will be OK and the response data will always be 0.

Check the status of the received data by changing the actual parallel terminal status.

# Get All Parallel Terminal Status

Gets the ON/OFF status of all parallel terminals except for DI terminals.

For how to set, refer to the following example and the description in the table. Example:

When you want to get the terminal status except DI terminal of Line 0.

- 1. Send a command to get the all of the terminal status to the specified port number of Line0.
- 2. All of the parallel terminal status except DI are responded.

### Command (PLC to Sensor Controller)

# Set Communications Input Status

Permits/prohibits inputs to the Communications Modules.

Any communication module whose input state is set to Prohibit (0) accepts no communications whatsoever. However, inputs related to hardware (parallel STEP signals/DSA signals and ECAT STEP, etc.) are not included in the prohibition.

# Set Parallel Terminal Status

Sets the ON/OFF status of the specified parallel I/O terminal.

Specifies the Parallel terminal with a combination of terminal type, terminal number, and terminal status.

For how to set, refer to the following example and the description in the table.

Example:

When you want to set the OR3 of Line3 status.

- 1. Select 6 in terminal type, OR is set.
- 2. Select 3 in terminal number, OR3 is set.
- 3. Select 1 in terminal status, OR3 terminal switches from OFF to ON.
- 4. Send the command set in the above step 1 to 3 to the port number of Line 3.
- 5. Executed results of the command is responded.

### **Precautions for Correct Use**

- When the Multi-line Random-trigger mode is selected in the following series, usable signal type or assignment are differ depending on the used number of Lines.
  - FH-1000 series
  - FH-2000 series
  - FH-3000 series
  - FH-5000 series

For more details of Operation mode, refer to *Multi-line Random-trigger Mode Signal Specifications* on page 2-384.

• The terminal status of each line can be got by sending this command to the port number allocated to them. For signals that are common in all lines, the terminal status can be got from any line used.

When the terminal state of an unusable or a different line was set, the response code will be OK and the set terminal state will be discarded.

Check the status of the received data by changing the actual parallel terminal status.

# Set All Parallel Terminal Status

Sets the ON/OFF status of all parallel terminals except for DO terminals.

For how to set, refer to the following example and the description in the table. Example:

When you want to set the Parallel terminal status, except DO of Line 0, to ON at once:

- 1. Set the terminal status ON to the desired assignment BIT of Parallel terminal except DO.
- 2. Send the specified command set in the above step 1 to the port number of Line 0.
- 3. Executed results of the command is responded.

\*1. Regarding the storage destination folder

The storage destination folder differ according to the Sensor Controller series.

• FH series/FHV series

RAM disk: C:\Data\RAMDisk

External storage device: E:\, F:\

• Do not save to any folder except RAMDisk and external storage device (such as C:\ProgramFiles\FZ). It is possible not to perform correctly due to the decrease of Scene data storage region.

# Get Image Logging Folder Name

Gets the image logging folder name.

# Get Parallel Terminal Offset

Gets the parallel DI terminal offset data that is set.

The parallel DI terminal offset is the value that is added to the DI0-DI4 command parameter when a parallel command is executed.

This command is only performed properly after the offset value was set using Set Parallel Terminal Offset command.

Command Area	code	15 - 12	11 - 8	7 - 4	3 - 0	Description
+2	4030	0100	0000	0011	0000	Command code
+3	0050	0000	0000	0101	0000	
+4	-	0000	0000	0000	0000	Name of the image capture
+5	-	0000	0000	0000	0000	folder with the absolute path.
:	_	0000	0000	0000	0000	Up to 227 characters

First word in	irst word in Command		B	lit		
Response Area	code	15 - 12	11 - 8	7 - 4	3 - 0	Description
+2	4030	0100	0000	0011	0000	Command code
+3	0050	0000	0000	0101	0000	Response target command co- des

First word in	First word in Command		E	Bit		
Response Area	code	15 - 12	11 - 8	7 - 4	3 - 0	Description
+4	-	0000	0000	0000	0000	Response code
+5	-	0000	0000	0000	0000	Command execution result OK: 0 (0000 0000) NG: Not 0 (0000 0000)

# Set Image Logging Prefix

Sets the prefix for the file name in which logged images are saved.

#### Command (PLC to Sensor Controller)

First word in	First word in Command		E	Bit	_	
Command Area	code	15 - 12	11 - 8	7 - 4	3 - 0	Description
+2	4040	0100	0000	0100	0000	Command code
+3	0050	0000	0000	0101	0000	
+4	-	0000	0000	0000	0000	Image logging prefix
+5	-	0000	0000	0000	0000	Up to 32 characters
:	-	0000	0000	0000	0000	

### **Response (Sensor Controller to PLC)**

First word in	Command		E	Bit		
Response Area	code	15 - 12	11 - 8	7 - 4	3 - 0	Description
+2	4040	0100	0000	0100	0000	Command code
+3	0050	0000	0000	0101	0000	Response target command co- des
+4	_	0000	0000	0000	0000	Response code
+5	-	0000	0000	0000	0000	Command execution result OK: 0 (0000 0000) NG: Not 0 (0000 0000)

## Set Data Logging Conditions

Sets the data logging conditions.

First word in	Command		В	Bit			
Command Area	code	15 - 12	11 - 8	7 - 4	3 - 0	Description	
+2	4050	0100	0000	0101	0000	Command code	
+3	0050	0000	0000	0101	0000		

First word in	Command		E	Bit		
Command Area	code	15 - 12	11 - 8	7 - 4	3 - 0	Description
+4	-	0000	0000	0000	0000	Data logging condition
+5	-	0000	0000	0000	0000	0: None
:	-	0000	0000	0000	0000	1: Only NG 2: All

First word in	Command		B	Bit		
Response Area	code	15 - 12	11 - 8	7 - 4	3 - 0	Description
+2	4050	0100	0000	0101	0000	Command code
+3	0050	0000	0000	0101	0000	Response target command co- des
+4		0000	0000	0000	0000	Response code
+5	-	0000	0000	0000	0000	Command execution result OK: 0 (0000 0000) NG: Not 0 (0000 0000)

## Set Parallel Terminal Offset

Sets the parallel DI terminal offset data.

The parallel DI terminal offset is the value that is added from the DI0 to DI4 command parameter when a parallel command is executed.

This is useful in the following cases.

Example:

This example is for creating a custom communications command for parallel communications that sets a numeric value using from DI0 to DI6.

• Without an Offset:

You can set only values between the minimum value of 0 and the maximum value of 127 (0111 1111 binary).

• With an Offset:

Adding an offset of *100* allows you to specify numeric values from a minimum value of 100 to a maximum value of 227 (127 + 100) by specifying the same values as those used without offsets.

First word in	Command		B	Bit		
Command Area	code	15 - 12	11 - 8	7 - 4	3 - 0	Description
+2	4060	0100	0000	0110	0000	Command code
+3	0050	0000	0000	0101	0000	
+4	-	0000	0000	0000	0000	Parallel DI terminal offset data
+5	-	0000	0000	0000	0000	0 to 9999

# Capture Screen

### Captures the screen.

The argument specifies a file name and extension in the absolute path of the save destination. The extension is "bmp". If there is no argument, the folder in which the captured image is saved is determined by the system data settings, and the file name is the time stamp. The extension is "bmp". For details, refer to *Capturing Screen Images* in the *Vision System FH/FHV Series User's Manual (Cat. No. Z365).*

### A-1-5 Non-procedure Command Details

This section describes details of commands used in Non-procedure communications.

## ALLIMAGESAVE or AIS

Writes all the image data in the image buffer (specified with **main unit logging image**) to external storage in ifz format.

<Command format>

or

<Response format>

When processing is performed normally:

OKCR

When processing is not performed normally:

### ERCR

<Parameters explanation>

Destination folder name	The folder name to save image data. Specify the folder name as an absolute path. The save destination to use differs by Sensor Controller model.			
	Save destination FH series/FHV series <sup>*1</sup>			
	RAMDisk	C:\Data\RAMDisk		
	External storage	E: F: G: H: M:\		

\*1. Do not specify a save destination other than RAMDisk or External storage. The saved Scene data area may be reduced and the Sensor Controller will not perform correctly.

### (Example)

When you save the data to *IMG01* folder of the external storage: <Command>

### $\begin{array}{|c|c|c|c|c|} \hline A & I & S & S & S & S & S \\ \hline A & I & S & S & S & S & S & S \\ \hline A & I & S & S & S & S & S \\ \hline A & I & S & S & S & S & S \\ \hline A & I & S & S & S & S & S \\ \hline A & I & S & S & S & S & S \\ \hline A & I & S & S & S & S & S \\ \hline A & I & S & S & S & S & S \\ \hline A & I & S & S & S & S & S \\ \hline A & I & S & S & S & S & S \\ \hline A & I & S & S & S & S & S \\ \hline A & I & S & S & S & S & S \\ \hline A & I & S & S & S & S & S \\ \hline A & I & S & S & S & S & S \\ \hline A & I & S & S & S & S & S \\ \hline A & I & S & S & S & S \\ \hline A & I & S & S & S & S \\ \hline A & I & S & S & S & S \\ \hline A & I & S & S & S & S \\ \hline A & I & S & S & S & S \\ \hline A & I & S & S & S & S \\ \hline A & I & S & S & S \\ \hline A & I & S & S & S \\ \hline A & I & S & S & S \\ \hline A & I & S & S & S \\ \hline A & I & S & S & S \\ \hline A & I & S & S & S \\ \hline A & I & S & S & S \\ \hline A & I & S & S \\ \hline A & I & S & S \\ \hline A & I & S & S \\ \hline A & I & S & S \\ \hline A & I & S & S \\ \hline A & I & S & S \\ \hline A & I & S & S \\ \hline A & I & S & S \\ \hline A & I & S & S \\ \hline A & I & S & S \\ \hline A & I & S & S \\ \hline A & I & S & S \\ \hline A & I & S$

# BKDLOAD

Reads system + scene group 0 data.

<Command format>

<Response format>

When processing is performed normally:

When processing is not performed normally:

ERCR

<Parameters explanation>

File name of system + scene group data	The name of the file containing the System data and Scene group 0 data you wish to load. Specify the file name as an absolute path. The file name needs the <i>BKD</i> extension. The file which has <i>BKD</i> extension can be load. The load destination to use differs by Sensor Controller model.				
	Load destination	FH series/FHV series			
	RAMDisk	C:\Data\RAMDisk			
	External storage E: F: G: H: M:\				

### **Precautions for Correct Use**

Do not turn off the power to the Sensor Controller until there is a response.

### (Example)

When you load the following case from the Sensor Controller:

- Drive name: USBDisk2
- Folder name of the external storage: IMG01
- File name: LABEL1.BKD

<Command>

BKDLOAD \USBDisk2 \IMG01 \LABEL1.BKD C<sub>R</sub>

## BKDSAVE

The system + scene group 0 data currently being used by the Sensor Controller is saved to a file.

<Command format>

<Response format>

When processing is performed normally:

When processing is not performed normally:

<Parameters explanation>

File name of system + scene group data	The name of the file containing the System data and Scene group 0 data you wish to save. Specify the folder name as an absolute path. The file name needs the <i>BKD</i> extension. The save destination to use differs by Sensor Controller model.				
	Save destination	FH series/FHV series <sup>*1</sup>			
	RAMDisk	C:\Data\RAMDisk			
	External storage	E: F: G: H: M:\			

\*1. Do not specify a save destination other than RAMDisk or External storage, i.e. C:\ProgramFiles\FZ. The saved Scene data area may be reduced and the Sensor Controller will not perform correctly.

### Precautions for Correct Use

Do not turn off the power to the Sensor Controller until there is a response.

### (Example)

When you save the following case to the Sensor Controller:

- Data: The current System + Scene group 0
- Drive name: USBDisk2
- Folder name of the external storage: IMG01
- File name: LABEL1.BKD

<Command>

### BKDSAVE \USBDisk2 \IMG01 \LABEL1.BKD CR

## OKCR

## **BRUNCHSTART or BFU**

Branches to the flow head (processing unit No. 0).

This command can only be executed when the corresponding flow control processing item is used.

<Command format>

## 

or

<Response format> When processing is performed normally:

### OKCR

When processing is not performed normally:

## CLRMEAS

Clears all of the measurement values of the current scene.

<Command format>

## 

<Response format> When processing is performed normally:

### OKCR

When processing is not performed normally:

Window display status after clearing

Judgment result	Unmeasured (0)
Value	0
Character string	Null character

# **CPYSCEN** or CSD

Copies the data for the scene with the number specified with command argument 1 to the scene with the number specified with command argument 2. If there is already data at the copy destination, the copied data is written over that data.

<Command format>

<Response format>

When processing is performed normally:

OKCR

When processing is not performed normally:

## ERCR

<Parameters explanation>

Copy destination scene No.	Specifies the scene No. to copy from (0 to the number of scenes in the scene group – 1).
Copy destination scene No.	Specifies the scene No. to copy to (0 to the number of scenes in the scene group – 1).

(Example) Copying the scene data for Scene 2 to Scene 10:

<Command>

CSD	2	10 <sup>c</sup> <sub>R</sub>
-----	---	------------------------------

<Response>

# DATALOGCOND or DLC

Getting the data logging condition

Gets the data logging condition for system data. Gets the *data logging condition* on the logging setting screen.

<Command format>

or

DLC<sup>C</sup><sub>R</sub>

<Response format> When processing is performed normally:

Data logging condition	с R
------------------------	--------

When processing is not performed normally:

ERCR

<Parameters explanation>

	0: None
Data logging condition	1: Only NG
	2: All

(Example)

When data logging condition is set to *None*: <Command>

<Response>

### OKCR

### Setting the data logging condition

Sets the data logging conditions for system data. Sets the *Data logging condition* on the Logging Setting window .

<Command format>

or

<Response format> When processing is performed normally:

## OK<sup>C</sup>R

When processing is not performed normally:

ERCR

<Parameters explanation>

	0: None
Data logging condition	1: Only NG
	2: All

### (Example)

When setting the data logging condition to All:

<Command>

# DATALOGFOLDER or DLF

### Getting the data logging folder name

Gets the set data logging folder name.

<Command format>

DATALOGFOLDER	C R
---------------	--------

or

## 

<Response format>

When processing is performed normally:

Data logging folder name	C R
--------------------------	--------

### OKCR

When processing is not performed normally:

<Parameters explanation>

Data logging folder name Responds with the data logging folder name with its absolute path.

(Example) When setting the logging data save destination to *RAMDisk*:

<Command>

<Response>

### **Setting the data logging folder name** Sets the data logging folder name.

<Command format>

- Data logging folder name (128 characters max.)

or

D	L	F		C R

Data logging folder name (128 characters max.)

<Response format>

When processing is performed normally:

When processing is not performed normally:

ERCR

<Parameters explanation>

	The name of the file containing the data when data logging performs. Specify the file name as an absolute path. The save destination to use differs by Sensor Controller model.		
Data logging folder name	Save destination	FH series/FHV series <sup>*1</sup>	
	RAMDisk	C:\Data\RAMDisk	
	External storage	E: F: G: H: M:\	

\*1. Do not specify a save destination other than RAMDisk or External storage, i.e. C:\ProgramFiles\FZ The saved Scene data area may be reduced and the Sensor Controller will not perform correctly.

### (Example)

When setting the data logging folder name to USBDisk:

<Command>

# DATASAVE

Saves System + Scene group data to the Sensor Controller's memory.

<Command format>

## DATASAVECR

<Response format> When processing is performed normally:

### OKCR

When processing is not performed normally:

## ERCR

### Additional Information

- Executing DATASAVE command while you use Scene group 1 to 31, System + Scene group data is saved to the Sensor Controller's memory.
- Do not turn off the power to the Sensor Controller until there is a response.

# DATE

Getting date and time

Gets the date and time from the internal calendar timer in the Sensor Controller.

<Command format>

<Response format>

When processing is performed normally:

### OKCR

When processing is not performed normally:

<Parameters explanation>

Year/Month/Date/Hour/Minute/Second	Year: 4 digits
	Month: 2 digits
	Date: 2 digits
	Hour: 2 digits
	Minute: 2 digits
	Second: 2 digits

(Example)

When the current date and time is 08/30/2007, 12:30:00:

<Command>

<Response>

### Setting date and time

Changes the date and time of the internal calendar timer in the Sensor Controller.

<Command format>

<Response format>

When processing is performed normally:

### OKCR

When processing is not performed normally:

### ER<sup>C</sup>R

### **Additional Information**

<Hour: 2 digits>, <Minute: 2 digits>, and <Second: 2 digits> can be omitted during setting. Settings cannot be updated when these are omitted, however, and the previous time will be kept unchanged.

Allowable omission patterns include *omitting <second> only*, *omitting <minute> and <second>*, and *omitting <hour>,<minute>, and <second>*. Patterns that cannot be used include *omitting <hour> only* and *omitting <minute> only*.

### (Example)

When changing the date and time to 8/30/2007, 12:30:00:

<Command>

# **DELSCENE** or DSD

Deletes the data for the scene whose number is specified with command argument 1.

<Command format>

or

<Response format> When processing is performed normally:

When processing is not performed normally:

<Parameters explanation>

Scene No.	Specify the scene No. to delete the scene data for (0 to the number of scenes in the scene
Scelle No.	group -1).

(Example)

Deleting the scene data for Scene 2:

<Command>

# **DIOFFSET or DIO**

Gets or sets the value of the parallel DI terminal offset data.

The parallel DI terminal offset is the value that is added to the DI0 to DI4 command parameter when a parallel command is executed.

It is convenient to use a parallel DI terminal offset in cases such as the following.

Example: Creating a custom communications command for parallel communications that sets a numeric value using DI0 to DI6:

• Without an Offset:

You can set only values between the minimum value of 0 and the maximum value of 27 (0111 1111 binary).

• With an Offset:

Adding an offset of *100* allows you to specify numeric values from a minimum value of *100* to a maximum value of 227 (127+ 100) by specifying the same values as those used without offsets.

### Getting the parallel DI terminal offset data

Gets the parallel DI terminal offset data.

After the Set Parallel Terminal Offset command was performed to set the offset value, this command is only performed properly.

<Command format>

or

<Response format> When processing is performed normally:

### Terminal offset data <sup>C</sup><sub>R</sub>

When processing is not performed normally:

ERCR

<Parameters explanation>

Parallel DI terminal	This is the value that is set for the parallel DI terminal offset data (0 - 9999).
offset data	This is the value that is set for the parallel Di terminal onset data (0 - 3333).

(Example)

When the parallel DI terminal offset data is 10:

### **Additional Information**

When the value of the parallel DI terminal offset data is set to *10*, the Switch Scene parallel command will change the scene to scene 10 instead of scene 0 when *0* is specified in the target scene parameter.

<Command>

<Response>

10<sup>c</sup><sub>R</sub>

### Sets the parallel DI terminal offset data

Sets the parallel DI terminal offset data.

<Command format>

or

-Parallel DI terminal offset data (max. 4 digits)

<Response format>

When processing is performed normally:

OKCR

When processing is not performed normally:

ERCR

<Parameters explanation>

Parallel DI terminal	This is the value that is set for the parallel DI terminal offset data (0 - 9999).
offset data	This is the value that is set for the parallel of terminal offset data (0 - 3333).

(Example) Setting the parallel DI terminal offset data to *10*. <Command>

<Response>

## **DIPORTCOND** or DPC

Gets the ON/OFF states of all parallel DI terminals at once.

For how to use the command to get status, refer to the following example.

Example:

To get the parallel DI terminal status of Line 0.

- 1. Send the parallel DI terminal status command to the port number assigned to Line 0.
- 2. A response of the parallel DI terminal status will be received.

<Command format>

### 

or

<Response format> When processing is performed normally:

Terminal state <sup>C</sup>R

When processing is not performed normally:

## ERCR

<Parameters explanation>

	Responds with the DI0-DI7 states (0-255).
	• 1st bit: DI0
Terminal state	• 2nd bit: DI1
	• 8th bit: DI7

### **Precautions for Correct Use**

This command gets the terminal state of each line by specifying its port number. When getting the terminal state of an unusable line, the response code will be OK and the response data will always be 0.

Check the status of the received data by changing the actual parallel terminal status.

(Example) When DI0 and DI4 are ON:

<Command>

<Response>

OKCR

## **DOPORTCOND** or **DPC**

Sets the ON/OFF states of all parallel DO terminals at once.

For how to set the DO terminal state, refer to the following.

Example:

When you set the parallel DO terminal state of Line 0 to ON:

- 1. Set the command which turns the terminal state ON to the parallel DO terminal of assignment BIT.
- 2. Send the command set in the above step 1 to the port number of Line 0.
- 3. Executed result is responded.

<Command format>

—Terminal state (max. 5 digits)

or

DPC

<Response format>

When processing is performed normally:

## OKCR

When processing is not performed normally:

<Parameters explanation>

Terminal state	Specify the DO terminals to switch ON (0-65535).    1st bit: DO0 2nd bit: DO1 :
	16th bit: DO15

### **Precautions for Correct Use**

This command sets the terminal state of each line by specifying its port number. When the terminal state of an unusable or a different line was set, the response code will be OK and the set terminal state will be discarded. Check the status of the received data by changing the actual parallel terminal status.

(Example) When setting DO0 and DO4 ON:

<Command>

<Response>

# ECHO or EEC

Returns as is any character string sent by an external device. Only single-byte alphanumerics can be used.

<Command format>

When processing is not performed normally:

## ER<sup>C</sup>R

#### <Parameters explanation>

Arbitrary	
character	Sets the character string returned as is. The response is the character string set here as is.
string	

(Example)

When returning the character string "TEST."

<Command>

EECTES	T C R
--------	-------

<Response>

# IMAGECAPTURE or EIC

### Captures the screen.

The folder into which the captured image is saved depends on the system data setting. The file name depends on the argument.

• No argument: Time stamp

For details, refer to Capturing Screen Images in the Vision System FH/FHV Series User's Manual (Cat. No. Z365).

• Argument: Saves with the file name in the argument. If the file name extension is other than ".bmp", then ".bmp" is added to the file name.

<Command format> No argument:

or

With argument:

or

### <Response format>

When processing is performed normally:

When processing is not performed normally:

### ERCR

#### <Parameters explanation>

File name	The folder name to save image data when image logging performs.Specify the folder name as an absolute path.The file name needs the "BMP" extension.The save destination to use differs by Sensor Controller model.		
	Save destination	FH series/FHV series <sup>*1</sup>	
	RAMDisk	C:\Data\RAMDisk	
	External storage	E: F: G: H: M:\	

\*1. Do not specify a save destination other than RAMDisk or External storage, i.e. C:\ProgramFiles\FZ The saved Scene data area may be reduced and the Sensor Controller will not perform correctly.

(Example)

When capturing an image to the file named *abc.bmp*.

<Command>

## IMAGECAPTUREFOLDER or ICF

### Getting the screen capture folder name

Gets the set screen capture folder name.

<Command format>

IMAGECAPTUREFOLDER
--------------------

or

## ICF<sup>C</sup><sub>R</sub>

<Response format>

When processing is performed normally:

Screen capture	folder	name	C R
----------------	--------	------	-----

### 

When processing is not performed normally:

<Parameters explanation>

Screen capture fold-	Responds with the name of the folder that the screen capture is saved to with its abso-
er name	lute path.

### (Example)

When the screen capture save destination is set to RAMDisk:

<Command>

<Response>

### Setting the screen capture folder name

Sets the screen capture folder name.

<Command format>

 Screen capture folder name (128 characters max.)

or

Ι	С	F			C R
			I	s	ı Sore

- Screen capture folder name (128 characters max.)

<Response format> When processing is performed normally:

OKCR

When processing is not performed normally:

### ER<sup>C</sup>R

<Parameters explanation>

	Image display window number. Specify the folder name as an absolute path. The save destination to use differs by Sensor Controller model.		
Screen capture folder name	Save destination	FH series/FHV series <sup>*1</sup>	
	RAMDisk	C:\Data\RAMDisk	
	External storage	E: F: G: H: M:\	

\*1. Do not specify a save destination other than RAMDisk or External storage, i.e. C:\ProgramFiles\FZ The saved Scene data area may be reduced and the Sensor Controller will not perform correctly.

### (Example)

When setting the screen capture folder name to USBDisk:

<Command>

A-1 Command Control

Α

A-1-5 Non-procedure Command Details

# IMAGEDISPCOND or IDC

### Gets image mode

Gets the image mode for the specified Image Display window.

#### <Command format>

or

-Image display window number (2 digits max.)

<Response format> When processing is performed normally:

Image mode <sup>C</sup><sub>R</sub>

When processing is not performed normally:

# ERCR

<Parameters explanation>

Image display window num- ber	Display image window number FH: Image display window number (0 to 23)
Image mode	0: Through
	1: Freeze or Freeze and Last NG together
	2: Last NG

### (Example)

When getting the image mode of the image display window 1 (through):

<Command>

IDC	1	с <sub>R</sub>
-----	---	----------------

<Response>

Sets image mode

Sets the image mode for the specified Image Display window.

<Command format>

When processing is performed normally:

## OKCR

When processing is not performed normally:

# ERCR

<Parameters explanation>

Image display window num-	Display image window number	
ber	FH: Image display window number (0 to 23)	
Image mode	0: Through	
	1: Freeze or Freeze and Last NG together	
	2: Last NG	

#### (Example)

When setting Last NG for the image mode for the image display window 1:

<Command>

# **IMAGEFIT** or **EIF**

Returns the display position and display zoom ratio for the image display window to their default values.

<Command format>

or

<Response format>

When processing is performed normally:

OKCR

When processing is not performed normally:

<Parameters explanation>

Image display window num-	Number of the image display window to return the display position and display
ber	magnification to their default values.
Dei	FH: Image display window number (0 to 23)

### (Example)

When returning the display position and display zoom ratio for the image display window *1* to their default values

<Command>

ΕI	F		1	с R
----	---	--	---	--------

# IMAGELOGFOLDER or ILF

## Getting the image logging folder name

Gets the set image logging folder name.

<Command format>

IMAGELOGFOLD	E R <sup>C</sup> <sub>R</sub>
--------------	-------------------------------

or

# I L F <sup>C</sup><sub>R</sub>

<Response format> When processing is performed normally:

Image	logging	prefix	C

# 

When processing is not performed normally:

<Parameters explanation>

Image logging folder name	Responds with the name of the folder the logging image is saved to with its absolute path.
------------------------------	--

(Example) When the image logging save destination is set to *RAMDisk*: <Command>

<Response>

# 

## **Setting the image logging folder name** Sets the image logging folder name.

<Command format>

Α

<Response format> When processing is performed normally:

When processing is not performed normally:

<Parameters explanation>

	Specify the folder name as	mage data when image logging performs. s an absolute path. se differs by Sensor Controller model.
Image Logging folder name	Save destination	FH series/FHV series <sup>*1</sup>
	RAMDisk	C:\Data\RAMDisk
	External storage	E: F: G: H: M:\

\*1. Do not specify a save destination other than RAMDisk or External storage. The saved Scene data area may be reduced and the Sensor Controller will not perform correctly.

### (Example)

When setting the image logging folder name to USBDisk:

<Command>

# IMAGELOGHEADER or ILH

## Getting the prefix for the name of the file the image logging is saved to

Gets the prefix for the name of the file the image logging is saved to. The maximum length of the prefix character string is 32 characters.

<Command format>

ΙΜΑ	GE	LOG	ΗΕΑ	DER	C R
-----	----	-----	-----	-----	--------

or

ILH<sup>C</sup><sub>R</sub>

<Response format> When processing is performed normally:

Image logging prefix <sup>C</sup> F	Image	logging	prefix	C R
-------------------------------------	-------	---------	--------	--------

# OK<sup>C</sup>R

When processing is not performed normally:

<Parameters explanation>

Image logging prefix	Responds with the prefix for the name of the file the image logging is saved to.
----------------------	--

(Example)

When the prefix for the name of the file the image logging is saved to is set to abc:

<Command>

<Response>

## Setting the prefix for the name of the file the image logging is saved to

Sets the prefix for the name of the file the image logging is saved to. The maximum length of the prefix character string is 32 characters.

<Command format>

or

Ι	L	Н		
			1	
				1

Image logging prefix (32 characters max.)

<Response format> When processing is performed normally:

CR

When processing is not performed normally:

<Parameters explanation>

	Sets the prefix for the name of the file the image logging is saved to (with a maxi-		
Image logging prefix	mum of 32 characters).		
	The set character string is added at the beginning of the name of the save file.		

(Example)

When setting *abc* as the prefix for the name of the file the image logging is saved to: <Command>

# **IMAGESCROLL** or EIS

The image display window whose number is specified is moved the specified distance in parallel. The setting range for the movement distance is not restricted. Also, because the scale for movement is independent of the display zoom ratio, the movement is not affected by change in the zoom ratio.

<Command format>

or

<Response format>

When processing is performed normally:

## OKCR

When processing is not performed normally:

# ERCR

#### <Parameters explanation>

Image display window num- ber	Number of the image display window to return the display position and display magnification to their default values. FH: Image display window number (0 to 23)
Movement amount X	Sets the X-direction movement distance (camera coordinate system).
Movement amount Y	Sets the Y-direction movement distance (camera coordinate system).

(Example)

Α

When moving the image display window *1* image in parallel *20* in the X direction and *10* in the Y direction:

<Command>

<Response>

# **IMAGESUBNO** or ISN

#### Getting the number of the currently displayed sub-image.

Gets the number of the sub-image currently displayed in the specified image display window.

<Command format>

Image display window number (2 digits max.)

or

-Image display window number (2 digits max.)

<Response format> When processing is performed normally:

Sub image number <sup>C</sup><sub>R</sub>

When processing is not performed normally:

<Parameters explanation>

Image display window num-	Number of the image display window for which to get the image mode.	
ber	FH: Image display window number (0 to 23)	
Sub image number	Responds with the number of the sub-image displayed in the image display win- dow.	

#### (Example)

When setting 2 as the number of the sub-image displayed in image display window 1.

<Command>

# ISN 1<sup>C</sup><sub>R</sub>

<Response>

## Setting the number of the currently displayed sub-image

Sets the number of the sub-image displayed in the specified image display window.

#### <Command format>

<Response format>

When processing is performed normally:

## OKCR

When processing is not performed normally:

# ERCR

<Parameters explanation>

Image display window num-	Number of the image display window for which to get the image mode.
ber	FH: Image display window number (0 to 23)
Sub image number	Sets the number (0 to 31) of the sub-image displayed in the current image display window.

### (Example)

When getting the number of the sub-image being displayed in image display window 1:

<Command>

# OKCR

# **IMAGEUNITNO** or IUN

## Getting the number of the currently displayed unit

Gets the number of the unit currently displayed in the specified image display window.

<Command format>

or

Image display window number (2 digits max.)

<Response format>

When processing is performed normally:

When processing is not performed normally:

#### <Parameters explanation>

Image display window num-	Number of the image display window for which to get the unit number.	
ber	FH: Image display window number (0 to 23)	
Unit No.	Responds with the number of the unit displayed in the current image display win- dow.	

(Example)

When getting the number (0) of the unit being displayed in image display window 1: <Command>

## Setting the number of the displayed unit

Sets the number of the unit displayed in the specified image display window.

<Response format> When processing is performed normally:

# 

When processing is not performed normally:

<Parameters explanation>

Image display window num-	Number of the image display window for which to get the unit number.		
ber	FH: Image display window number (0 to 23)		
Unit No.	Sets the number (0 to number of units in current scene $-1$ ) of the unit displayed		
	in the image display window.		

(Example)

When setting 2 as the number of the unit displayed in image display window 1. <Command>

# IMAGEZOOM or EIZ

Zooms the image display window whose number is specified in or out to the specified zoom ratio. The zoom ratio here is the ratio compared to the original image (100%).

When processing is not performed normally:

## ERCR

<Parameters explanation>

Image display window num-	Number of the image display window to return the display position and display magnification to their default values.
ber	FH: Image display window number (0 to 23)
Magnification	Sets the zoom ratio (250-16,000). 250 means 25%; 16,000 means 1600%.

(Example)

When zooming in image display window 1 to 200%:

<Command>

<Response>

# IMGSAVE

Saves image data.

<Command format>

<Response format> When processing is performed normally:

OKCR

When processing is not performed normally:

# ERCR

<Parameters explanation>

	Specifies the No. of the image data to be saved(0 to max. number of logging
	images (I_MAX)). <sup>*1</sup>
	The maximum number of logging images can be a number with a maximum of
	3 digits. The number of images will vary depending on the Sensor Controller
Image data No.	used and the camera connected. The image data number of the latest image
	is 0.
	For details of the maximum number of images that can be logged (I_MAX), re-
	fer to Number of Logged Images in the Vision System FH/FHV Series User's
	Manual (Cat. No. Z365).

Destination folder name	The folder name to save image data. Specify the folder name as an absolute path. The file name needs the "IFZ" extension. The save destination to use differs by Sensor Controller model.		
Destination forder hame	Save destination	FH series/FHV series <sup>*2</sup>	
	RAMDisk	C:\Data\RAMDisk	
	External storage	E: F: G: H: M:\	

- \*1. The maximum number of images that can be logged depends on the model of the Sensor Controller that you use and the models and number of connected Cameras For details of the maximum number of images that can be logged (I\_MAX), refer to *Number of Logged Images* in the *Vision System FH/FHV Series User's Manual (Cat. No. Z365)*.
- \*2. Do not specify a save destination other than RAMDisk or External storage, i.e. C:\ProgramFiles\FZ The saved Scene data area may be reduced and the Sensor Controller will not perform correctly.

### Precautions for Correct Use

- If the specified file name already exists, this existing file will be overwritten.
- Do not turn off the power to the Sensor Controller until there is a response.

#### (Example)

When you save the following case:

- Number of image data: 3
- File name: LABEL1.IFZ
- Drive name: USBDisk2
- Folder name of the external storage: IMG01

<Command>

## IMGSAVE 3 \USBDisk2 \IMG01 \ LABEL1.IFZ CR

# INPUTTRANSSTATE or ITS

### Getting communication module input states

Gets the input state (permitted/prohibited) for communication modules.

<Command format>

or

I T S Communication module types (1 digit)

<Response format> When processing is performed normally:

Input state <sup>C</sup><sub>R</sub>

When processing is not performed normally:

# ERCR

<Parameters explanation>

	0: Serial (Ethernet)
Communication module	1: Serial (RS-232C/422)
-	2: Parallel IO
types	3: Fieldbus
	4: Remote operation
Innut atata	0: Prohibited
Input state	1: Permitted

### (Example)

Getting the input status when serial (Ethernet) inputs are enabled (= 1):

<Command>

# OKCR

### Setting communication module input states

Permits/prohibits input to communication modules.

Any communication module whose input state is set to Prohibit (0) accepts no communications whatsoever. However, inputs related to hardware (parallel STEP signals/DSA signals and ECAT STEP, etc.) are not included in the prohibition.

<Command format>

When processing is performed normally:

# OKCR

When processing is not performed normally:

(Example) Setting the serial (RS-232C/422) input state to prohibited:

<Command>

# LASTIMAGESAVE or LIS

### Executes a save of the last input image.

The character string handed over by the argument is used as the file name.

<Command format>

$\sim$	r
υ	L
-	-

— File name (max. 256 digits)

<Response format>

When processing is performed normally:

When processing is not performed normally:

ERCR

<Parameters explanation>

	The folder name to save image data. Specify the folder name as an absolute path. The save destination differs by Sensor Controller model.	
File name	Save destination	FH series/FHV series <sup>*1</sup>
	RAMDisk	C:\Data\RAMDisk
	External storage	E: F: G: H: M:\

\*1. Do not specify a save destination other than RAMDisk or External storage.

The saved Scene data area may be reduced and the Sensor Controller will not perform correctly.

### (Example)

When saving the last input image to the file named *abc.ifz*:

<Command>

#### **Additional Information**

- When the extension is ifz, the image is saved with the specified file name.
- When the extension is anything other than ifz, the image is saved with ifz appended to the file name.
- If there is no extension (only the folder name is given), the image is saved to a file named time stamp .ifz.

# LAYOUTNO or DLN

Gets or sets the current layout number.

### **Precautions for Correct Use**

For non-remote operation, only 0: Local can be specified. For remote operation, only 1: Remote can be specified.

If any combination other than the above is used, unexpected operation may occur when the command is executed.

#### Getting the layout number

Gets the number of the currently displayed layout.

<Command format>

or

DLN CR Acquisition target

<Response format> When processing is performed normally:

Layout number C<sub>R</sub>

## OKCR

When processing is not performed normally:

<Parameters explanation>

Acquisition target	0: Local
	1: Remote
Layout number	Current layout number (0 to 8)

(Example)

When the currently displayed window (local) is the RUN window::

<Command>

<Response>

### Setting the layout number

Sets the layout number and switches the window.

<Command format>

or

<Response format> When processing is performed normally:

# 

When processing is not performed normally:

(Example) When displaying the RUN window (local):

<Command>

# LOGINACCOUNT or LAI

### Gets the user name for the currently logged in user account.

Gets the user ID for the currently logged in account.

<Command format>

or

- Acquisition target (1 digit)

<Response format> When processing is performed normally:

When processing is not performed normally:

# ER C<sub>R</sub>

<Parameters explanation>

Acquisition target	0: Local	
	1: Remote	
User ID	Returns the user ID in the user account used by the user currently logging in.	

### (Example)

Getting the name of the user (abc) that is currently logged in (local):

<Command>

<Response>

**Switching the currently logged in account** Switches the currently logged in account. <Command format>

Setting target (1 digit)

<Response format>

When processing is performed normally:

## 

When processing is not performed normally:

## ERCR

<Parameters explanation>

Settable Objects	0: Local 1: Remote
User ID	Specify the ID for the user to switch (32 characters maximum).
Password	Specify the password for the user to switch (32 characters maximum).

## (Example)

When switching to user ID abc with password efg (local):

#### <Command>

# LOGINACCOUNTGROUP or LAG

Gets the group ID in the user account used by the user currently logging in.

<Command format>

or

- Acquisition target (1 digit)

<Response format> When processing is performed normally:

|--|

## OKCR

When processing is not performed normally:

<Parameters explanation>

Acquisition target	0: Local	
	1: Remote	
Group ID	Returns the group ID in the user account used by the user currently logging in.	

#### (Example)

The following sample command returns user group ID *UG1* in the user account used by the user currently logging in:

<Command>

# **MEASURE** or M

### **Executing measurement**

Executes measurement one time.

<Command format>

<Response format>

When processing is performed normally:

• Non-procedure

• Normal (Fxxx series)

Measurement result C<sub>R</sub>

When processing is not performed normally:

# ER<sup>C</sup><sub>R</sub>

### Additional Information

For Normal (Fxxx series method), refer to 2-5-9 Command Formats on page 2-340.

<Parameters explanation>

	When "Data Output" is set in the flow, the measurement results are output.
Measurement result	When "Data Output" is not set, the measurement results are not output.
	Refer to 2-5-11 Output Format on page 2-346.

### Starts continuous measurement

Starts continuous measurement.

<Command format>

## 

<Response format> When processing is performed normally:

Continuous measurement count

When processing is not performed normally:

<Parameters explanation>

	When "Data Output" is set in the flow, the measurement results are output.
Measurement result	When "Data Output" is not set, the measurement results are not output.
	Refer to 2-5-11 Output Format on page 2-346.

#### **Completes continuous measurement**

Continuous measurement ends.

<Command format>

### 

<Response format>

When processing is performed normally:

When processing is not performed normally:

ERCR Measurement result CR Measurement result

Measurement is continuously executed

#### **Additional Information**

To output measurement results, insert a Data Output processing unit in the scene. When the scene does not have a Data Output processing unit, only a command response is output. For detail, refer to 2-5-11 Output Format on page 2-346 and 2-2-5 Output Data Settings (Processing Item Registration) on page 2-152.

# **MEASUREUNIT** or MTU

Performs a test measurement on the specified unit.

<Command format>

or

<Response format> When processing is performed normally:

# 

When processing is not performed normally:

ERCR

<Parameters explanation>

Unit No.	Specifies the unit number to run a test with: 0 to the uppermost unit model number in the
	scene.

### (Example)

The following sample command runs a test on unit number *5*: <Command>

# **MOVESCENE** or MSD

Copies the data for the scene with the number specified with command argument 1 to the scene with the number specified with command argument 2. Deletes scene data with a number specified by command argument 1 after completing copying. If there is already data at the copy destination, the copied data is written over that data.

<Command format>

<Response format>

When processing is performed normally:

When processing is not performed normally:

<Parameters explanation>

Source scene num-	Specifies the scene number to copy scene data from: 0 to the number of the scenes in
ber	the scene group -1.
Target scene num-	Specifies the target scene number for copying scene data: 0 to the number of the scenes
ber	in the scene group −1.

(Example)

The following sample command moves the scene data saved under scene 2 to scene 10:

<Command>

# OPELOGCOND or OLC

### Gets logging operation state

Gets the logging operation state.

<Command format>

or

<Response format> When processing is performed normally:

log	ging	operation	state	С
	61116	0001 4 6 1 011	ocuco	

# 

When processing is not performed normally:

<Parameters explanation>

Logging opera-	0: OFF
tion state	1: ON

### (Example)

The following sample command returns an enabled logging operation state:

<Command>

<Response>

OKCR

#### Sets logged operation state

Sets the logged operation state. This command allows configuring the logging operation state in the same manner as for the Start/End Logging Operation buttons on the Main screen.

<Command format>

## Gets output state to external device

Gets the output state to an external device: Enabled or Disabled:

<Command format>

# $O|U|T|P|U|T|T|R|A|N|S|S|T|A|T|E|^{c_{R}}$

or

OTS<sup>C</sup><sub>R</sub>

<Response format> When processing is performed normally:

Output state <sup>C</sup>R

When processing is not performed normally:

<Parameters explanation>

Output state	0: Prohibited
	1: Permitted

### (Example)

The following sample command retrieves the output state, *Enabled*:

<Command>

<Response>

OKCR

### Sets the output state to external device

Permits/prohibits output to external devices.

When the input state is disabled, i.e., set to (0), all the communications modules are unable to transmit data.

<Command format>

or

OTS CR Output state (1 digit)

<Response format> When processing is performed normally:

When processing is not performed normally:

(Example) Setting the output status to external devices to prohibited or prohibiting output to external devices: <Command>

<Response>

# PARAALLCOND or PAC

## Gets all parallel terminal states at once, except for DI terminals

Gets the ON/OFF states of all parallel terminals at once, except for DI terminals.

For how to set, refer to the following contents or example.

Example:

When you want to get the parallel terminal state of Line 0 except DO to turn ON at once:

- 1. Send this command to the port number set on Line 0.
- 2. The parallel terminal state except DI is responded.

<Command format>

or

<Response format> When processing is performed normally:

Terminal state <sup>C</sup>R

OK<sup>C</sup>R

When processing is not performed normally:

# ERCR

<Parameters explanation>

### **Precautions for Correct Use**

• When the Multi-line Random-trigger mode is selected in the following series, usable signal type or assignment are differ depending on the used number of Lines.

- FH-1000 series
- FH-2000 series
- FH-3000 series
- FH-5000 series

For more details of Operation mode, refer to *Multi-line Random-trigger Mode Signal Specifications* on page 2-384.

• The terminal status of each line can be got by sending this command to the port number allocated to them. For signals that are common in all lines, the terminal status can be got from any line used.

When the terminal status for an unusable line or a different line was got, the response code will be OK and the response data will always be 0.

Check the status of the received data by changing the actual parallel terminal status.

#### (Example)

The following sample command returns the state of enabled STEP0 and DSA1:

<Command>

<Response>

The response of 1001 (binary) is given as 9 (decimal).

#### Sets all parallel terminal states at once, except for DO terminals

Sets the ON/OFF state of all Parallel terminals except for DO terminals.

For how to set, refer to the following:

```
Example)
```

When you want to set the Parallel DO terminals state of Line 0, to ON at once:

- 1. Set the terminals state ON to the desired assignment BIT of the Parallel DO terminal state.
- 2. Send the specified command set in the above step 1 to the port number of Line 0.
- 3. Executed result of command is responded.

<Command format>

### **Precautions for Correct Use**

- When the Multi-line Random-trigger mode is selected in the following series, usable signal type or assignment are differ depending on the used number of Lines.
  - FH-1000 series
  - FH-2000 series
  - FH-3000 series
  - FH-5000 series

For more details of Operation mode, refer to *Multi-line Random-trigger Mode Signal Specifications* on page 2-384.

• The terminal status of each line can be got by sending this command to the port number allocated to them. For signals that are common in all lines, the terminal status can be got from any line used.

When the terminal state of an unusable or a different line was set, the response code will be OK and the set terminal state will be discarded.

Check the status of the received data by changing the actual parallel terminal status.

#### (Example)

The following sample command activates RUN:

<Command>

# PARAPORTCOND or PPC

#### Gets the specified status of parallel I/O

Gets the ON/OFF information of specified parallel I/O terminal.

Specify the parallel terminal with combination of terminal type and terminal number.

For how to set, refer to the following:

Example:

When you want to get the terminal status of STEP0 and Line0

- 1. Set 0 in terminal type, STEP is specified.
- 2. Set 0 in terminal number, STEP0 of Line0 is specified.
- 3. Send the specified command set in the above step 1 and 2 to the port number of Line0.
- 4. The specified terminal status is responded.

name/Registered im-	number (0 to 999).
age number	

(Example)

a. When loading a registered image file, ABC.ifz, as a measured image:

<Command>

# R I D ABC. I F Z <sup>c</sup><sub>R</sub>

<Response>

b. When loading an image with registered image number 100 as a measured image:

<Command>

<Response>

#### Precautions for Correct Use

JPG (JFZ) format image files cannot be registered or loaded.

# RESET

Restart the Sensor Controller.

<Command format>

<Response format> None

# SCENE or S

Gets scene number

Gets the current scene No.

<Command format>

<Response format> When processing is performed normally:

OK<sup>C</sup>R

Scene No. (3 digits max.)

or

When processing is not performed normally:

ERCR

<Parameters explanation>

Scene No. The got scene No. (currently used scene No.) is output as a response
--

(Example) When scene 0 is being used:

<Command>

<Response>

Switch Scene No. Switches the scene number to be used.

<Command format>

----Scene No. (3 digits max.)

<Response format> When processing is performed normally:

### OKCR

When processing is not performed normally:

<Parameters explanation>

Scene No.

Specifies the scene No. after switching (0 to 127).

(Example) When switching to scene 2:

<Command>

<Response>

# SCNDATA

#### Gets scene variable value

Gets the value for a set scene variable.

<Command format>

SCNDATA variable name + type idetifier

<Response format> When processing is performed normally:

Current value C<sub>R</sub>

When processing is not performed normally:

<Parameters explanation>

Variable name + type identi- fier	<ul> <li>Specifies a scene variable to get with the variable name and the type identifier.</li> <li>Specify a scene variable with the variable name and the type identifier. <i>SC</i> that indicates the kind of variables is not necessary. Ex.: When <i>SC.aaa&amp;</i> is specified, enter <i>aaa&amp;</i></li> <li>When an array is specified for scene variables, specify its elements. Ex.: Enter like aaa&amp;(10), bbb#(3.5).</li> <li>An error will be returned when the number of array dimensions or the number of its elements is wrongly specified. Ex.: An error is returned if getting bbb#(0) from bbb#(20,10) were attempted. Ex.: An error is returned if getting the value for ccc&amp;(10) were attempted when the defined array variable (ccc&amp;) is one dimension and the number of its elements is five.</li> <li>If a non-existant variable name were specified, an error will be returned depending on the set contents. 1) An error is returned if Option Explicit commands are used in Scene control macro. 2) Other than 1), the current value = 0 is returned.</li> </ul>
Current value	The current value for the set variable is returned.

#### Sets value to scene variable

Sets a value to the element of a scene variable.

<Command format>

S	С	Ν	D	А	Т	А		variable name + type identifier		Set value	C <sub>R</sub>	
---	---	---	---	---	---	---	--	---------------------------------	--	-----------	----------------	--

#### <Response format>

When processing is performed normally:

### 

When processing is not performed normally:

### ERCR

<Parameters explanation>

Variable name + type identi- fier	<ul> <li>Specifies a scene variable to get with the variable name and the type identifier.</li> <li>Specify a scene variable with the variable name and the type identifier. <i>SC</i> that indicates the kind of variables is not necessary. Ex.: When <i>SC.aaa&amp;</i> is specified, enter <i>aaa&amp;</i></li> <li>When an array is specified for scene variables, specify its elements. Ex.: Enter like aaa&amp;(10), bbb#(3.5).</li> <li>An error will be returned when the number of array dimensions or the number of its elements is wrongly specified. Ex.: An error is returned if getting bbb#(0) from bbb#(20,10) were attempted. Ex.: An error is returned if getting the value for ccc&amp;(10) were attempted when the defined array variable (ccc&amp;) is one dimension and the number of its elements is five.</li> <li>If a non-existant variable name were specified, an error will be returned depending on the set contents. 1) An error is returned if Option Explicit commands are used in Scene control macro. 2) Other than 1), the current value = 0 is returned.</li> </ul>
--------------------------------------	---

ect Use ue were specified to a variable set by the variable name and the type t returned but the following processing is applied.
e name and type identifier are an integer type, if a floating-point value ble: value are rounded down. et, -1 is set. When 1.7 is set, 1 is set.) e name and type identifier are a floating-point type, if an integer value e: ded and set. (Ex.: When 35 are set, 35.0 set set.) e name and type identifier are an integer type or a floating-point type, if a set to the variable: e name and type identifier are a character string type, if an integer or vere set to the variable.

#### **Additional Information**

If the value of a non-existent variable were set when Option Explicit command is not used in Scene control macro, a variable area will be secured and the set value will be set to it. However, the variable will not be displayed in the scene variable window. When the scene variable is newly added, the set value becomes visible.

# SCNGROUP or SG

#### Gets scene group number

Gets the current scene group No.

<Command format>

or

<Response format>

When processing is performed normally:

Scene group No. (max. 2 digits)

O K CR

When processing is not performed normally:

ERCR

<Parameters explanation>

Scene group No.	The acquired scene group No. (currently used scene group No.) is output as a response (0 to 31).

(Example)

When scene group 0 is being used:

<Command>

<Response>

#### Switches the scene group number

Switches the scene group number to be used.

<Command format>

<Response format> When processing is performed normally:

### OKCR

When processing is not performed normally:

<Parameters explanation>

Scene group No. Specifies the scene group No. after switching (0 to 31).

(Example) When switching to scene group 2:

<Command>

#### 

<Response>

#### Precautions for Correct Use

Do not switch the scene group during parallel continuous measurement or when the STEP signal is being input continuously. If you must switch the scene group at one of these times, set *Unchecked* in *Save scene group on scene switch* in either of the settings items below.

- Refer to Changing the Scene or Scene Group in the Vision System FH/FHV Series User's Manual (Cat. No.Z365).
- Refer to Setting the Conditions That Are Related to Operation during Measurement in the Vision System FH/FHV Series User's Manual (Cat. No.Z365).

# SCNLOAD

Loads scene data.

<Command format>

<Response format>

When processing is performed normally:

When processing is not performed normally:

### ERCR

<Parameters explanation>

Scene No.	Specifies the s	cene No. to be read (0 to	o 127)		
File name of scene data	The name of the file containing the Scene data you wish to load.				
	Specify the file name as an absolute path.				
	The file name needs the "SCN" extension.				
	The file which has "SCN" extension can be load.				
	The load destir	nation to use differs by S	ensor Controller model.		
		Save destination	FH series/FHV series		
		RAMDisk	C:\Data\RAMDisk		
		E: F: G: H: M:\			

#### **Precautions for Correct Use**

Do not turn off the power to the Sensor Controller until there is a response.

(Example)

When you load the following case to the Sensor Controller as Scene 2:

- SCNLOAD folder name: LABEL1.SCN
- Drive name: USBDisk2
- Folder name of the external storage: IMG01

<Command>

<Response>

Α

# SCNSAVE

Saves scene data.

<Command format>

<Response format>

When processing is performed normally:

When processing is not performed normally:

### ERCR

<Parameters explanation>

Scene number	Specify the Scene number to save. (0 to 127)				
	The name of the file containing the Scene data you wish to save.				
	Specify the file name as an absolute path.				
	The file name needs the "SCN" extension.				
Destination	Save destination folder differ depending on the Sensor Controller series.				
Doomation	Save destination	FH series/FHV series <sup>*1</sup>			
	RAMDisk	C:\Data\RAMDisk			
	External storage E: F: G: H: M:\				

\*1. Do not specify a save destination other than RAMDisk or External storage. The saved Scene data area may be reduced and the Sensor Controller will not perform correctly.

#### **Precautions for Correct Use**

- If the specified file name already exists, this existing file will be overwritten.
- Do not turn off the power to the Sensor Controller until there is a response.
- For the FH/FHV series, do not save to a non-volatile area on the C drive (such as C:\ProgramFiles\FZ).

This would reduce the storage area for scene data etc. and make correct operation impossible.

#### (Example)

When you save the following case:

- Scene number: 3
- SCNSAVE file name: LABEL1.SCN
- Drive name: USBDisk2
- Folder name of the external storage: IMG01

<Command>

### SCNSAVE 3 \USBDisk2 \IMG01 \ LABEL1.SCN CR

<Response>

# SGRLOAD

Loads scene group data.

<Command format>

<Response format>

When processing is performed normally:

When processing is not performed normally:

ERCR

<Parameters explanation>

Scene group No.	Specifies the scene group No. to be loaded (0 to 31)		
File name of Scene group data	The name of the file containing the Scene group data you wish to load. Specify the file name as an absolute path. The file name needs the "SGP" extension. The file which has "SGP" extension can be load. The load destination to use differs by Sensor Controller model.		
	Load destination	FH series/FHV series	
	RAMDisk	C:\Data\RAMDisk	
	External storage	E: F: G: H: M:\	

#### Precautions for Correct Use

Do not turn off the power to the Sensor Controller until there is a response.

(Example)

When you load the following case:

- Scene group number: 3
- SCNLOAD file name: LABEL1.SGP
- Drive name: USBDisk2
- Folder name of the external storage: IMG01

<Command>

#### SGRLOAD 3 \USBDisk2 \IMG01 \ LABEL1.SGP CR

<Response>

### OKCR

#### Additional Information

For the USB memory drive, see *Saving Data to the FH/FHV* in the *Vision System FH/FHV Series User's Manual (Cat. No. Z365).* 

### SGRSAVE

Saves scene group data.

<Command format>

<Response format> When processing is performed normally:

When processing is not performed normally:

#### <Parameters explanation>

Scene group No.	Specifies the scene group No. to save (0 to 31).			
	The name of the file containing the Scene Group data you wish to save. Specify the folder name as an absolute path. The file name needs the "SGP" extension. The save destination folder differs depending on the Sensor Controller series.			
Destination	Save destination	FH series/FHV series *1		
	RAMDisk	C:\Data\RAMDisk		
	External storage	E: F: G: H: M:\		

\*1. Do not specify a save destination other than RAMDisk or External storage, i.e. C:\ProgramFiles\FZ The saved Scene data area may be reduced and the Sensor Controller will not perform correctly.

#### **Precautions for Correct Use**

- If the specified file name already exists, this existing file will be overwritten.
- Do not turn off the power to the Sensor Controller until there is a response.
- For the FH/FHV series, do not save to a non-volatile area on the C drive (such as C:\ProgramFiles\FZ).

This would reduce the storage area for scene data etc. and make correct operation impossible.

#### (Example)

When you save the following case:

- Scene group number: 3
- SCNSAVE file name: LABEL1.SGP
- Drive name: USBDisk2
- Folder name of the external storage: IMG01

<Command>

SGRSAVE 3 \USBDisk2 \IMG01 \ LABEL.SGP CR

# SYSDATA

#### Gets settings related to logging

Gets settings related to current logging.

<Command format>

<Response format> When processing is performed normally:

Measurement value CR

When processing is not performed normally:

ER<sup>C</sup>R

<Parameters explanation>

Data	Identifier	Setting value
		0: None
Image logging	imageLogging	1: Only NG
		2: All
Folder name of image logging save	imagal agging Directory	Save destination folder name (one-
destination	imageLoggingDirectory	byte alphanumeric character)
Drofix for image logging file name	imagal againg laadar	Prefix for image logging file name
Prefix for image logging file name	imageLoggingHeader	(one-byte alphanumeric characters)
		0: None
Data logging	dataLogging	1: Only NG
		2: All
Name of destination folder for sav-	datal agging Directory	Save destination folder name (one-
ing data logging	dataLoggingDirectory	byte alphanumeric character)

#### Precautions for Correct Use

The save destination folder differs depending on the Sensor Controller model.For the FH/FHV series, do not save to a non-volatile area on the C drive (such as C:\ProgramFiles\FZ). This would reduce the storage area for scene data etc. and make correct operation impossible.

Save destination	FH series/FHV series
RAMDisk	C:\Data\RAMDisk
External storage	E: F: G: H: M:\

#### (Example)

N

Getting the image logging setting when the setting for the current image logging save condition is 1 (save only NG):

<Command>

### SYSDATA Logging ing imageLogging 🖓

<Response>

The current image logging save condition is 1: Only NG.

#### Changes settings related to logging

Changes settings related to logging.

<Command format>

<Response format> When processing is performed normally:

When processing is not performed normally:

### ERCR

<Parameters explanation>

Data	Identifier	Setting value
		0: None
Image logging	imageLogging	1: Only NG
		2: All
Folder name of image logging save	imagal agging Directory	Save destination folder name (one-
destination	imageLoggingDirectory	byte alphanumeric character)
Drofix for image logging file name	imageLoggingHeader	Prefix for image logging file name
Prefix for image logging file name	InageLoggingHeader	(one-byte alphanumeric characters)
		0: None
Data logging	dataLogging	1: Only NG
		2: All
Name of destination folder for sav-	datal agging Directory	Save destination folder name (one-
ing data logging	dataLoggingDirectory	byte alphanumeric character)

#### Precautions for Correct Use

The save destination folder differs depending on the Sensor Controller model.For the FH/FHV series, do not save to a non-volatile area on the C drive (such as C:\ProgramFiles\FZ). This would reduce the storage area for scene data etc. and make correct operation impossible.

Save destination	FH series/FHV series
RAMDisk	C:\Data\RAMDisk
External storage	E: F: G: H: M:\

#### (Example)

a. When creating settings so that data logging is only performed during NG errors:

<Command>

|--|

# SYSLOAD

Loads system data.

<Command format>

<Response format>

When processing is performed normally:

When processing is not performed normally:

### ERCR

<Parameters explanation>

File name of System data	The name of the file containing the System data you wish to load. Specify the file name as an absolute path. The file name needs the "INI" extension. The file which has "INI" extension can be load. The load destination to use differs by Sensor Controller model. Load destination		
		Load destination	FH series/FHV series
		RAMDisk	C:\Data\RAMDisk
		External storage	E: F: G: H: M:\

#### Precautions for Correct Use

Do not turn off the power to the Sensor Controller until there is a response.

(Example)

When you load the following case:

- SYSLOAD file name: LABEL1.INI
- Drive name: USBDisk2
- Folder name of the external storage: IMG01

<Command>

SYSLOAD \USBDisk2\IMG01\LABEL.INI CR

# SYSSAVE

Saves system data.

<Command format>

SYSSAVE	C <sub>R</sub>
	Save destination

<Response format>

When processing is performed normally:

When processing is not performed normally:

### ERCR

#### <Parameters explanation>

Destination	The name of the file containing the System data you wish to save. Specify the folder name as an absolute path. The file name needs the "INI" extension. Save destination folder differs depending on the Sensor Controller series.		
	Save destination	FH series/FHV series *1	
	RAMDisk	C:\Data\RAMDisk	
	External storage	E: F: G: H: M:\	

\*1. Do not specify a save destination other than RAMDisk or External storage, i.e. C:\ProgramFiles\FZ The saved Scene data area may be reduced and the Sensor Controller will not perform correctly.

#### **Precautions for Correct Use**

- If the specified file name already exists, this existing file will be overwritten.
- Do not turn off the power to the Sensor Controller until there is a response.
- For the FH/FHV series, do not save to a non-volatile area on the C drive (such as C:\ProgramFiles\FZ).

This would reduce the storage area for scene data etc. and make correct operation impossible.

#### (Example)

When you save the following case:

- SYSSAVE file name: LABEL1.INI
- Drive name: USBDisk2
- Folder name of the external storage: IMG01

<Command>

#### SYSSAVE \USBDisk2\IMG01\LABEL.INI CR

# 

Α

# TIMER or TMR

Issues the specified command string after a specified delay.

<Command format>

<Response format>

When processing is performed normally:

OKCR

When processing is not performed normally:

ERCR

<Parameters explanation>

Latency	Specifies the required delay to when the specified command is issued in milliseconds, 100 to 99999.
Command string	Specifies the command string. (Max: 1,024 characters)

(Example)

Getting the current scene number (scene 1) after 3,000 [ms].

<Command>

T M R 3 0 0 0 S C<sub>R</sub>

<Response>

1 <sup>C</sup><sub>R</sub>

# UNITDATA or UD

#### Getting processing unit parameters and measurement values

The set parameters and measurement values for the processing units set in the scene currently being used are got.

<Command format>

#### <Response format>

When processing is performed normally:

Measurement value C<sub>R</sub>

When processing is not performed normally:

<Parameters explanation>

Processing unit No.	Specifies the processing unit number (0 to the number of unit items $-1$ ).
External reference ta- ble No.	Varies depending on the specified processing unit processing items. For details, refer to <i>External Reference Table</i> for each processing item in the <i>Vision System FH/FHV series Processing Item Function Reference Manual(Cat. No. Z341).</i>
Measurement value	The acquired measurement value is output as a response.

(Example)

Getting the value of the search judgment result (external reference No. 0) that was set in processing unit 5 for the judgement OK status:

<Command>

UNIT	DATA	5 0	C <sub>R</sub>
------	------	-----	----------------

<Response>

#### Changing processing unit parameters

The set parameters for the processing units set in the scene currently being used are changed.

<Command format>

<Response format> When processing is performed normally:

### OKCR

When processing is not performed normally:

### ER <sup>C</sup><sub>R</sub>

<Parameters explanation>

Processing unit No.	Specifies the processing unit number (0 to the number of unit items $-1$ ).
External reference ta- ble No.	Varies depending on the specified processing unit processing items. For details, refer to <i>External Reference Table</i> for each processing item in the <i>Vision System FH/FHV series Processing Item Function Reference Manual</i> ( <i>Cat. No. Z341</i> ).
Setting Data	Sets the value of the settings data.

#### (Example)

a. When *Skipping angle* (external reference table No. 124 value) in **Search** set as the 6th processing unit (processing unit number *5*) is changed to *10*:

<Command>

<Response>

b. When *Verification string* (external reference table No. 139 value) in **Character Inspection** set as the 7th processing unit (processing unit number 6) is changed to *ABC* 

<Command>

#### **Additional Information**

To set a character string which includes spaces, enclose the character string with " ". Example:

Setting the character string to compare (value of the external reference table No. 164 value) as "ABC EFG" of the second processing unit (Processing unit No.1). UNITDATA 1 164 "ABC EFG"

# UPDATEMODEL or UMD

Re-registers a model using the current image.

<Command format>

<Response format> When processing is performed normally:

When processing is not performed normally:

### ER<sup>C</sup><sub>R</sub>

<Parameters explanation>

Processing unit No.	Specifies the processing unit number of a model to re-register: 0 to the number of unit items – 1.
Model No.	Specifies the model number to register a model: 0 to the uppermost unit model num-
	ber in the unit.
	Specifying a nonexistent model number causes an error.

	Specifies the target data.
	When the setting value is expressed in binary, if the 1st bit is 1, the model is re-regis-
	tered.
	When the setting value is expressed in binary, if the 2nd bit is 1, the reference posi-
	tion is updated.
Target data	When the setting value is expressed in binary, if the 3rd bit is 1, the detection posi-
Talget data	tion is updated.
	Example)
	• When only re-registering the model: 1 x 1 + 2 x 0 + 4 x 0 = 1 (setting value)
	• When only updating the reference position: 1 x 0 + 2 x 1 + 4 x 0 = 2 (setting value)
	• When updating or re-registering everything: 1 x 1 + 2 x 1 + 4 x 1 = 7 (setting val-
	ue)

(Example)

The following sample command re-registers a model with unit number *3*, model number *0* and target data *1*:

<Command>

UMD 3	0	1	C R
-------	---	---	--------

<Response>

### USERACCOUNT or UAD

#### Adds user account to specified user group

Adds the user account to the specified affiliated group ID.

If the user account for the set image is already registered, that setting is overwritten.

<Command format>

<Response format> When processing is performed normally:

# 

When processing is not performed normally:

## ER<sup>C</sup>R

<Parameters explanation>

Group	Specifies a group ID to which a user account is to be added: 0 to 7.
User ID	Specifies a user ID of the user to be added with up to 32 characters.
Password	Specifies a password for the user to be added with up to 32 characters.
User name (UG0)	Specifies the user name for a user belonging to the UG0 group (32 characters maximum).
Password (UG0)	Specifies the password for the above UG0 group user (32 characters maximum).

#### (Example)

Using the UG0 password *efg* for user *olduser* to add an account with user name *newuser* with password *abc* in the UG0 group

<Command>

								_		_		_	_	_	_		_			_					
UΑ	ום		In	e	w	ul:	sl	e	r	a	b	С		0		d	lu	s	е	l r		е	f	la	C
	-	ľ		Ŭ		~	<u> </u>	Ŭ	•	~	~	Ľ		Ľ		~	Ű.		Ľ	· ·		Ŭ	· ·	9	R

<Response>

#### Deletes user account

Deletes the specified user account.

If the specified user account does not exist, the command returns OK without doing any processing at all.

<Command format>

<Response format>

When processing is performed normally:

### OKCR

When processing is not performed normally:

<Parameters explanation>

User ID	Specifies the user ID of the user to be deleted with up to 32 characters.
User name (UG0)	Specifies the user name for a user belonging to the UG0 group (32 characters maximum).
Password (UG0)	Specifies the password for the above UG0 group user (32 characters maximum).

(Example)

Using the UG0 password *efg* for user *olduser* to delete an account with user name *newuser* with password *abc*:

<Command>

		er efg <sup>C</sup> <sub>R</sub>
		/           9   R

<Response>

# VERGET

Gets the Sensor Controller version information.

<Command format>

<Response format>

When processing is performed normally:

Version information		/	1	C <sub>R</sub>
		7		Date Mont

When processing is not performed normally:

<Parameters explanation>

Varaian information	Sensor Controller model name
Version information	Software version

(Example) When your software version is 5.00, and the date is June 1, 2013:

<Command>

<Response>

F Z / F H / F	J - X	x x x	V	е	r	5	0	0	2	0	1	3	/	0	6	/	0	1 <sup>C</sup> <sub>R</sub>
